16-Bit MCU and DSC Programmer's Reference Manual

High-Performance Microcontrollers (MCU) and Digital Signal Controllers (DSC)

© 2005-2018 Microchip Technology Inc.

Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as "unbreakable."

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

Information contained in this publication regarding device applications and the like is provided only for your convenience and may be superseded by updates. It is your responsibility to ensure that your application meets with your specifications. MICROCHIP MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WHETHER EXPRESS OR IMPLIED, WRITTEN OR ORAL, STATUTORY OR OTHERWISE, RELATED TO THE INFORMATION, INCLUDING BUT NOT LIMITED TO ITS CONDITION, QUALITY, PERFORMANCE, MERCHANTABILITY OR FITNESS FOR PURPOSE**.** Microchip disclaims all liability arising from this information and its use. Use of Microchip devices in life support and/or safety applications is entirely at the buyer's risk, and the buyer agrees to defend, indemnify and hold harmless Microchip from any and all damages, claims, suits, or expenses resulting from such use. No licenses are conveyed, implicitly or otherwise, under any Microchip intellectual property rights unless otherwise stated.

Microchip received ISO/TS-16949:2009 certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona; Gresham, Oregon and design centers in California and India. The Company's quality system processes and procedures are for its PIC® MCUs and dsPIC® DSCs, KEELOQ® code hopping devices, Serial EEPROMs, microperipherals, nonvolatile memory and analog products. In addition, Microchip's quality system for the design and manufacture of development systems is ISO 9001:2000 certified.

Section 1. Introduction

HIGHLIGHTS

This section of the manual contains the following major topics:

1.1 Introduction 6
1.2 Manual Objective 6
1.3 Development Support 6
1.4 Style and Symbol Conventions 7
1.5 Instruction Set Symbols 8

© 2005-2018 Microchip Technology Inc.

1.1 INTRODUCTION

Microchip Technology focuses on products for the embedded control market. Microchip is a leading supplier of the following devices and products:

- 8-Bit General Purpose Microcontrollers (PIC® MCUs)
- 16-Bit Digital Signal Controllers (dsPIC® DSCs)
- 16-Bit and 32-Bit Microcontrollers (MCUs)
- Specialty and Standard Nonvolatile Memory Devices
- Security Devices (KEELOQ® Security ICs)
- Application-Specific Standard Products

Information about these devices and products, with corresponding technical documentation, is available on the Microchip web site (www.microchip.com).

1.2 MANUAL OBJECTIVE

This manual is a software developer's reference for the 16-bit MCU and DSC device families. It describes the Instruction Set in detail and also provides general information to assist the development of software for the 16-bit MCU and DSC device families.

This manual does not include detailed information about the core, peripherals, system integration or device-specific information. The user should refer to the specific device family reference manual for information about the core, peripherals and system integration. For device-specific information, the user should refer to the specific device data sheets. The information that can be found in the data sheets includes:

- Device memory map
- Device pinout and packaging details
- Device electrical specifications
- List of peripherals included on the device

Code examples are given throughout this manual. These examples are valid for any device in the 16-bit MCU and DSC families.

1.3 DEVELOPMENT SUPPORT

Microchip offers a wide range of development tools that allow users to efficiently develop and debug application code. Microchip's development tools can be broken down into four categories:

- Code Generation
- Hardware/Software Debug
- Device Programmer
- Product Evaluation Boards

Information about the latest tools, product briefs and user guides can be obtained from the Microchip web site (www.microchip.com) or from your local Microchip Sales Office.

Microchip offers other reference tools to speed up the development cycle. These include:

- Application Notes
- Reference Designs
- Microchip Web Site
- Local Sales Offices with Field Application Support
- Corporate Support Line

The Microchip web site also lists other sites that may be useful references.

© 2005-2018 Microchip Technology Inc.

1.4 STYLE AND SYMBOL CONVENTIONS

Throughout this document, certain style and font format conventions are used. Table 1-1 provides a description of the conventions used in this document.

Table 1-1: Document Conventions

Symbol or Term	Description
set	To force a bit/register to a value of logic '1'.
clear	To force a bit/register to a value of logic '0'.
Reset	1. To force a register/bit to its default state. 2. A condition in which the device places itself after a device Reset occurs. Some bits will be forced to '0' (such as interrupt enable bits), while others will be forced to '1' (such as the I/O data direction bits).
0xnnnn	Designates the number 'nnnn' in the hexadecimal number system. These conventions are used in the code examples. For example, 0x013F or 0xA800.
: (colon)	Used to specify a range or the concatenation of registers/bits/pins. One example is ACCAU:ACCAH:ACCAL, which is the concatenation of three registers to form the 40-bit Accumulator. Concatenation order (left-right) usually specifies a positional relationship (MSb to LSb, higher to lower).
< >	Specifies bit locations in a particular register. One example is SR<7:5> (or IPL<2:0>), which specifies the register and associated bits or bit locations.
LSb, MSb	Indicates the Least Significant or Most Significant bit in a field.
LSB, MSB	Indicates the Least/Most Significant Byte in a field of bits.
lsw, msw	Indicates the least/most significant word in a field of bits
`Courier New Font`	Used for code examples, binary numbers and for Instruction mnemonics in the text.
Times New Roman Font, Italic	Used for equations and variables.
Times New Roman Font, Bold Italic	Used in explanatory text for items called out from a figure, equation or example.
Note:	A Note presents information that we want to re-emphasize, either to help you avoid a common pitfall or make you aware of operating differences between some device family members. A Note can be in a box, or when used in a table or figure, it is located at the bottom of the table or figure.

1.5 INSTRUCTION SET SYMBOLS

The summary tables in **Section 3.2 "Instruction Set Overview"** and **Section 7.2 "Instruction Set Summary Table"**, and the instruction descriptions in **Section 5.4 "Instruction Descriptions"** utilize the symbols shown in Table 1-2.

Table 1-2: Symbols Used in Instruction Summary Tables and Descriptions

Symbol[1]	Description
{ }	Optional field or operation
[text]	The location addressed by text
(text)	The contents of text
#text	The literal defined by text
a ∈ [b, c, d]	"a" must be in the set of [b, c, d]
<n:m>	Register bit field
{label:}	Optional label name
Acc	Accumulator A or Accumulator B
AWB	Accumulator Write-Back
bit4	4-bit wide bit position (0:7 in Byte mode, 0:15 in Word mode)
Expr	Absolute address, label or expression (resolved by the linker)
f	File register address
lit1	1-bit literal (0:1)
lit4	4-bit literal (0:15)
lit5	5-bit literal (0:31)
lit8	8-bit literal (0:255)
lit10	10-bit literal (0:255 in Byte mode, 0:1023 in Word mode)
lit14	14-bit literal (0:16383)
lit16	16-bit literal (0:65535)
lit23	23-bit literal (0:8388607)
Slit4	Signed 4-bit literal (-8:7)
Slit6	Signed 6-bit literal (-32:31) (range is limited to -16:16)
Slit10	Signed 10-bit literal (-512:511)
Slit16	Signed 16-bit literal (-32768:32767)
TOS	Top-of-Stack
Wb	Base Working register
Wd	Destination Working register (Direct and Indirect Addressing)
Wdo	Destination Working register (Direct and Indirect Addressing, including Indirect Addressing with Offset)
Wm, Wn	Working register divide pair (dividend, divisor)
Wm * Wm	Working register multiplier pair (same source register)
Wm * Wn	Working register multiplier pair (different source registers)
Wn	Both source and destination Working register (Direct Addressing)
Wnd	Destination Working register (Direct Addressing)
Wns	Source Working register (Direct Addressing)
WREG	Default Working register (assigned to W0)
Ws	Source Working register (Direct and Indirect Addressing)
Wso	Source Working register (Direct and Indirect Addressing, including Indirect Addressing with Offset)
Wx	Source Addressing mode and Working register for X data bus prefetch
Wxd	Destination Working register for X data bus prefetch
Wy	Source Addressing mode and Working register for Y data bus prefetch
Wyd	Destination Working register for Y data bus prefetch

Note 1: The range of each symbol is instruction-dependent. Refer to **Section 5. "Instruction Descriptions"** for the specific instruction range.

Section 2. Programmer's Model

HIGHLIGHTS

This section of the manual contains the following major topics:

2.1 16-Bit MCU and DSC Core Architecture Overview 10
2.2 Programmer's Model 14
2.3 Working Register Array 19
2.4 Default Working Register (WREG) 20
2.5 Software Stack Frame Pointer 20
2.6 Software Stack Pointer 20
2.7 Stack Pointer Limit Register (SPLIM) 20
2.8 Accumulator A and Accumulator B (dsPIC30F, dsPIC33F, dsPIC33E and dsPIC33C Devices) 20
2.9 Program Counter 21
2.10 TBLPAG Register 21
2.11 PSVPAG Register (PIC24F, PIC24H, dsPIC30F and dsPIC33F) 21
2.12 RCOUNT Register 21
2.13 DCOUNT Register (dsPIC30F, dsPIC33F, dsPIC33E and dsPIC33C Devices) 21
2.14 DOSTART Register (dsPIC30F, dsPIC33F, dsPIC33E and dsPIC33C Devices) 22
2.15 DOEND Register (dsPIC30F, dsPIC33F, dsPIC33E and dsPIC33C Devices) 22
2.16 STATUS Register 22
2.17 Core Control Register 25
2.18 Shadow Registers 25
2.19 DO Stack (dsPIC33E and dsPIC33C Devices) 26

© 2005-2018 Microchip Technology Inc.

2.1 16-BIT MCU AND DSC CORE ARCHITECTURE OVERVIEW

This section provides an overview of the 16-bit architecture features and capabilities for the following families of devices:

- 16-Bit Microcontrollers (MCU):
  - PIC24F
  - PIC24H
  - PIC24E
- 16-Bit Digital Signal Controllers (DSC):
  - dsPIC30F
  - dsPIC33F
  - dsPIC33E
  - dsPIC33C

2.1.1 Features Specific to 16-Bit MCU and DSC Core

The core of the 16-bit MCU and DSC devices is a 16-bit (data) modified Harvard architecture with an enhanced instruction set. The core has a 24-bit instruction word, with an 8-bit opcode field. The Program Counter (PC) is 23 bits wide and addresses up to 4M x 24 bits of user program memory space. An instruction prefetch mechanism is used to help maintain throughput and provides predictable execution. The majority of instructions execute in a single cycle.

2.1.1.1 REGISTERS

The 16-bit MCU and DSC devices have sixteen 16-bit Working registers. Each of the Working registers can act as a data, address or offset register. The 16th Working register (W15) operates as a Software Stack Pointer (SSP) for interrupts and calls.

2.1.1.2 INSTRUCTION SET

The instruction set is almost identical for the 16-bit MCU and DSC architectures. The instruction set includes many addressing modes and was designed for optimum C compiler efficiency.

2.1.1.3 DATA SPACE ADDRESSING

The data space can be addressed as 32K words or 64 Kbytes. The upper 32 Kbytes of the data space memory map can optionally be mapped into program space at any 16K program word boundary, which is a feature known as Program Space Visibility (PSV). The program to data space mapping feature lets any instruction access program space as if it were the data space, which is useful for storing data coefficients.

Note:	Some devices families support Extended Data Space (EDS) Addressing. See the specific device data sheet and family reference manual for more details on this feature.

2.1.1.4 ADDRESSING MODES

The core supports Inherent (no operand), Relative, Literal, Memory Direct, Register Direct, Register Indirect and Register Offset Addressing modes. Each instruction is associated with a predefined addressing mode group, depending upon its functional requirements. As many as seven addressing modes are supported for each instruction.

For most instructions, the CPU is capable of executing a data (or program data) memory read, a Working register (data) read, a data memory write and a program (instruction) memory read per instruction cycle. As a result, 3-operand instructions can be supported, allowing A + B = C operations to be executed in a single cycle.

© 2005-2018 Microchip Technology Inc.

2.1.1.5 ARITHMETIC AND LOGIC UNIT

A high-speed, 17-bit by 17-bit multiplier is included to significantly enhance the core's arithmetic capability and throughput. The multiplier supports Signed, Unsigned, and Mixed modes, as well as 16-bit by 16-bit, or 8-bit by 8-bit integer multiplication. All multiply instructions execute in a single cycle.

The 16-bit Arithmetic Logic Unit (ALU) is enhanced with integer divide assist hardware that supports an iterative non-restoring divide algorithm. It operates in conjunction with the REPEAT instruction looping mechanism, and a selection of iterative divide instructions, to support 32-bit (or 16-bit) divided by 16-bit integer signed and unsigned division. All divide operations require 19 cycles to complete, but are interruptible at any cycle boundary.

2.1.1.6 EXCEPTION PROCESSING

The 16-bit MCU and DSC devices have a vectored exception scheme with support for up to eight sources of non-maskable traps and up to 246 interrupt sources. In both families, each interrupt source can be assigned to one of seven priority levels.

2.1.2 PIC24E, dsPIC33E and dsPIC33C Features

In addition to the information provided in **Section 2.1.1 "Features Specific to 16-Bit MCU and DSC Core"**, this section describes the enhancements that are available in the PIC24E, dsPIC33E and dsPIC33C families of devices.

2.1.2.1 DATA SPACE ADDRESSING

The Base Data Space address is used in conjunction with a Read or Write Page register (DSRPAG or DSWPAG) to form an Extended Data Space (EDS) address, which can also be used for PSV access. The EDS can be addressed as 8M words or 16 Mbytes. Refer to **"Data Memory"** (DS70595) in the *"dsPIC33/PIC24 Family Reference Manual"* for more details on EDS, PSV and table accesses.

Note:	Some PIC24F devices also support Extended Data Space. Refer to **"CPU with Extended Data Space (EDS)"** (DS39732) and **"Data Memory with Extended Data Space (EDS)"** (DS39733) in the *"dsPIC33/PIC24 Family Reference Manual"* for details.

2.1.2.2 AUTOMATIC MIXED-SIGN MULTIPLICATION MODE (dsPIC33E AND dsPIC33C ONLY)

In addition to signed and unsigned DSP multiplications, dsPIC33E and dsPIC33C devices support mixed-sign (unsigned-signed and signed-unsigned) multiplications without the need to dynamically reconfigure the Multiplication mode and shift data to account for the difference in operand formats. This mode is particularly beneficial for dsPIC33C executing extended precision (32-bit and 64-bit) algorithms. Besides DSP instructions, MCU multiplication (MUL) instructions can also utilize either accumulator as a result destination, thereby enabling faster extended precision arithmetic. Refer to **Section 4.11.1 "Implied DSP Operands (dsPIC30F, dsPIC33F, dsPIC33E and dsPIC33C Devices)"** and **Section 4.21 "Extended Precision Arithmetic Using Mixed-Sign Multiplications (dsPIC33E and dsPIC33C Only)"** for more details on mixed-sign DSP multiplications.

2.1.2.3 MCU MULTIPLICATIONS WITH 16-BIT RESULT

16x16-bit MUL instructions include an option to store the product in a single 16-bit Working register rather than a pair of registers. This feature helps free up a register for other purposes, in cases where the numbers being multiplied are small in magnitude, and therefore, expected to provide a 16-bit result. See the individual MUL instruction descriptions in **Section 5.4 "Instruction Descriptions"** for more details.

2.1.2.4 HARDWARE STACK FOR DO LOOPS (dsPIC33E AND dsPIC33C ONLY)

The single-level DO Loop Shadow register set has been replaced by a 4-level deep DO loop hardware stack. This provides automatic DO Loop register save/restore for up to 3 levels of DO loop nesting, resulting in more efficient implementation of nested loops. Refer to **Section 2.19 "DO Stack (dsPIC33E and dsPIC33C Devices)"** for more details on DO loop nesting in dsPIC33E and dsPIC33C devices.

2.1.2.5 DSP CONTEXT SWITCH SUPPORT (dsPIC33E AND dsPIC33C ONLY)

In dsPIC33E and dsPIC33C devices, the DSP Overflow and Saturation Status bits are writable. This allows the state of the DSP engine to be efficiently saved and restored while switching between DSP tasks. See **Section 2.16.4 "DSP ALU Status Bits (dsPIC30F, dsPIC33F, dsPIC33E and dsPIC33C Devices)"** for more details on DSP Status bits. In addition, dsPIC33C devices have up to four additional sets of DSP Accumulators A and B for fast context switching. Please see the specific device data sheet for details.

2.1.2.6 EXTENDED CALL AND GOTO INSTRUCTIONS (PIC24E, dsPIC33E AND dsPIC33C ONLY)

The CALL.L Wn and GOTO.L Wn instructions extend the capabilities of the CALL Wn and GOTO Wn by enabling 32-bit addresses for computed branch/call destinations. In these enhanced instructions, the destination address is provided by a pair of Working registers, rather than a single 16-bit register. See the CALL.L and GOTO.L instruction descriptions in **Section 5.4 "Instruction Descriptions"** for more details.

2.1.2.7 COMPARE/BRANCH INSTRUCTIONS (PIC24E, dsPIC33E AND dsPIC33C ONLY)

PIC24E/dsPIC33E/dsPIC33C devices feature conditional Compare/Branch (CPBxx) instructions. These instructions extend the capabilities of the Compare/Skip (CPSxx) instructions by allowing branches, rather than only skipping over a single instruction. See the CPBEQ, CPBNE, CPBGT and CPBLT instruction descriptions in **Section 5.4 "Instruction Descriptions"** for more details on Compare/Branch instructions.

2.1.3 dsPIC30F, dsPIC33F, dsPIC33E and dsPIC33C Features

In addition to the information provided in **Section 2.1.1 "Features Specific to 16-Bit MCU and DSC Core"**, this section describes the DSP enhancements that are available in the dsPIC30F, dsPIC33F, dsPIC33E and dsPIC33C families of devices.

2.1.3.1 PROGRAMMING LOOP CONSTRUCTS

Overhead-free program loop constructs are supported using the DO instruction, which is interruptible.

2.1.3.2 DSP INSTRUCTION CLASS

The DSP class of instructions are seamlessly integrated into the architecture and execute from a single execution unit.

2.1.3.3 DATA SPACE ADDRESSING

The data space is split into two blocks, referred to as X and Y data memory. Each memory block has its own independent Address Generation Unit (AGU). The MCU class of instructions operates solely through the X memory AGU, which accesses the entire memory map as one linear data space. The DSP dual source class of instructions operates through the X and Y AGUs, which splits the data address space into two parts. The X and Y data space boundary is arbitrary and device-specific.

© 2005-2018 Microchip Technology Inc.

2.1.3.4 MODULO AND BIT-REVERSED ADDRESSING

Overhead-free circular buffers (Modulo Addressing) are supported in both X and Y address spaces. The Modulo Addressing removes the software boundary checking overhead for DSP algorithms. Furthermore, the X AGU Circular Addressing can be used with any of the MCU class of instructions. The X AGU also supports Bit-Reversed Addressing, to greatly simplify input or output data reordering for radix-2 FFT algorithms.

2.1.3.5 DSP ENGINE

The DSP engine features a high-speed, 17-bit by 17-bit multiplier, a 40-bit ALU, two 40-bit saturating accumulators and a 40-bit bidirectional barrel shifter. The barrel shifter is capable of shifting a 40-bit value, up to 16 bits right or up to 16 bits left, in a single cycle. The DSP instructions operate seamlessly with all other instructions and have been designed for optimal real-time performance. The MAC instruction and other associated instructions can concurrently fetch two data operands from memory while multiplying two Working registers. This requires that the data space be split for these instructions and linear for all others. This is achieved in a transparent and flexible manner through dedicating certain Working registers to each address space.

2.1.3.6 EXCEPTION PROCESSING

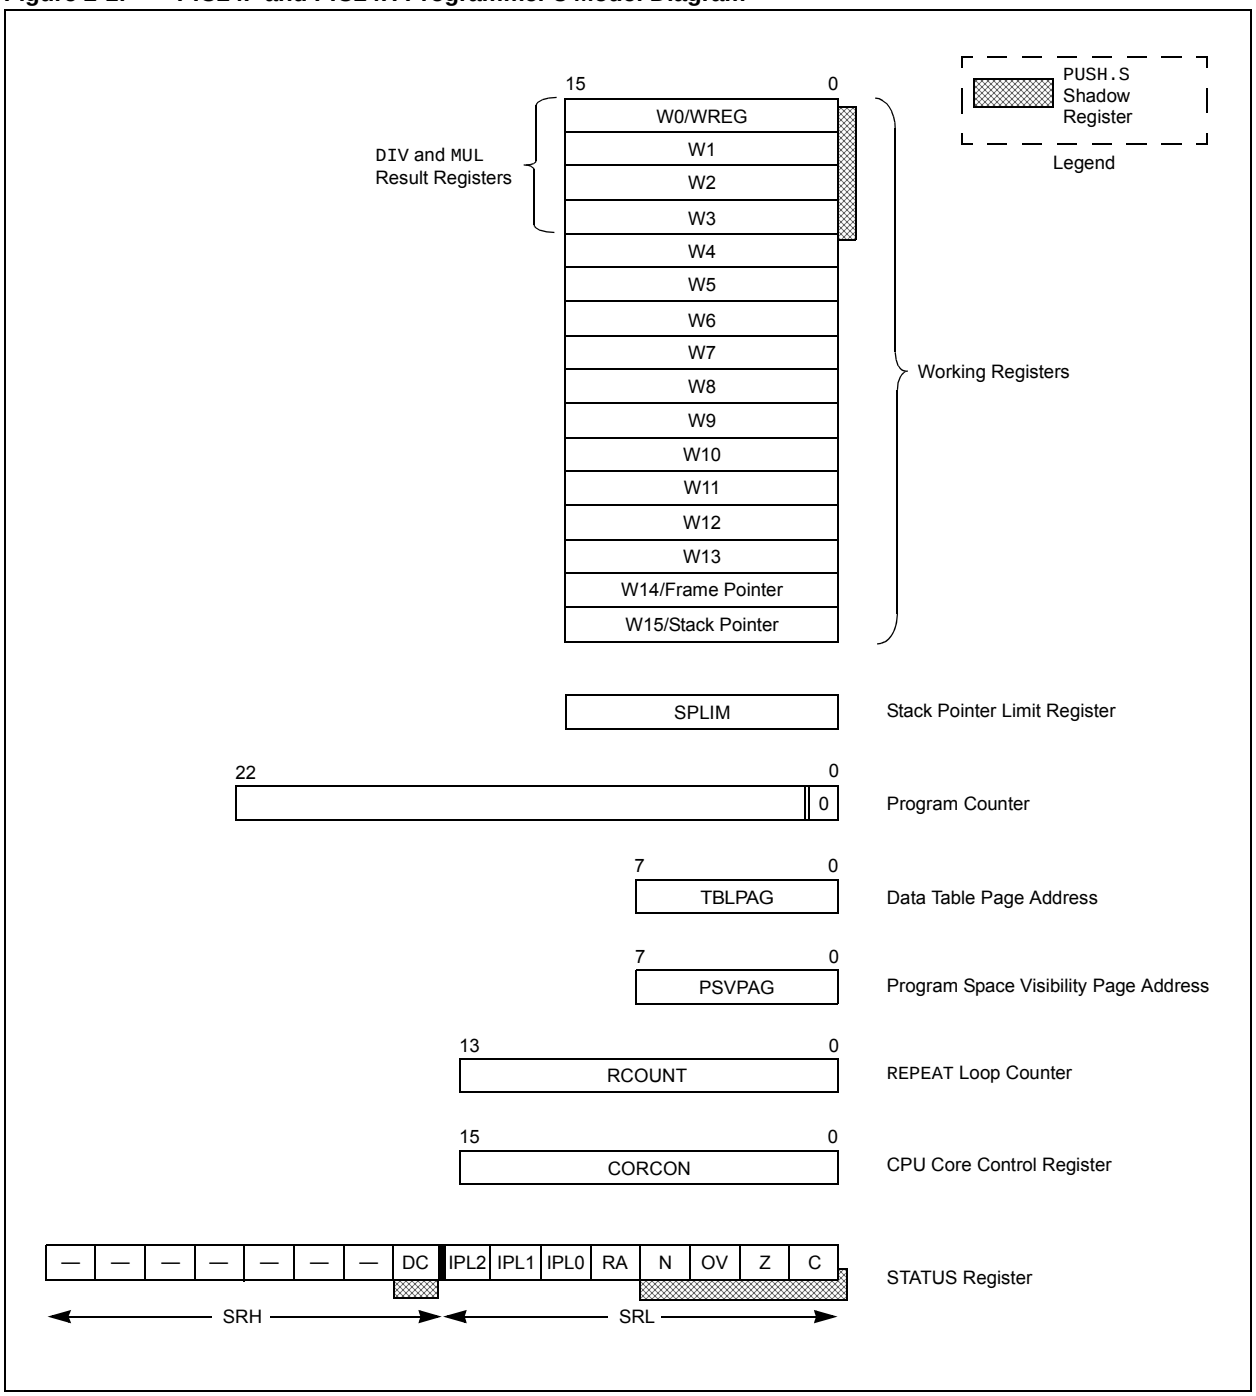
The dsPIC30F devices have a vectored exception scheme with support for up to eight sources of non-maskable traps and up to 54 interrupt sources. The dsPIC33F, dsPIC33E and dsPIC33C have a similar exception scheme, but support up to 118, and up to 246 interrupt sources, respectively. In all three families, each interrupt source can be assigned to one of seven priority levels.

Refer to **"Interrupts"** (DS70000600) of the *"dsPIC33/PIC24 Family Reference Manual"* for more details on exception processing.

2.2 PROGRAMMER'S MODEL

Figure 2-1 through Figure 2-5 show the programmer's model diagrams for the 16-bit MCU and DSC families of devices.

Figure 2-1: PIC24F and PIC24H Programmer's Model Diagram



© 2005-2018 Microchip Technology Inc.

Figure 2-2: PIC24E Programmer's Model Diagram

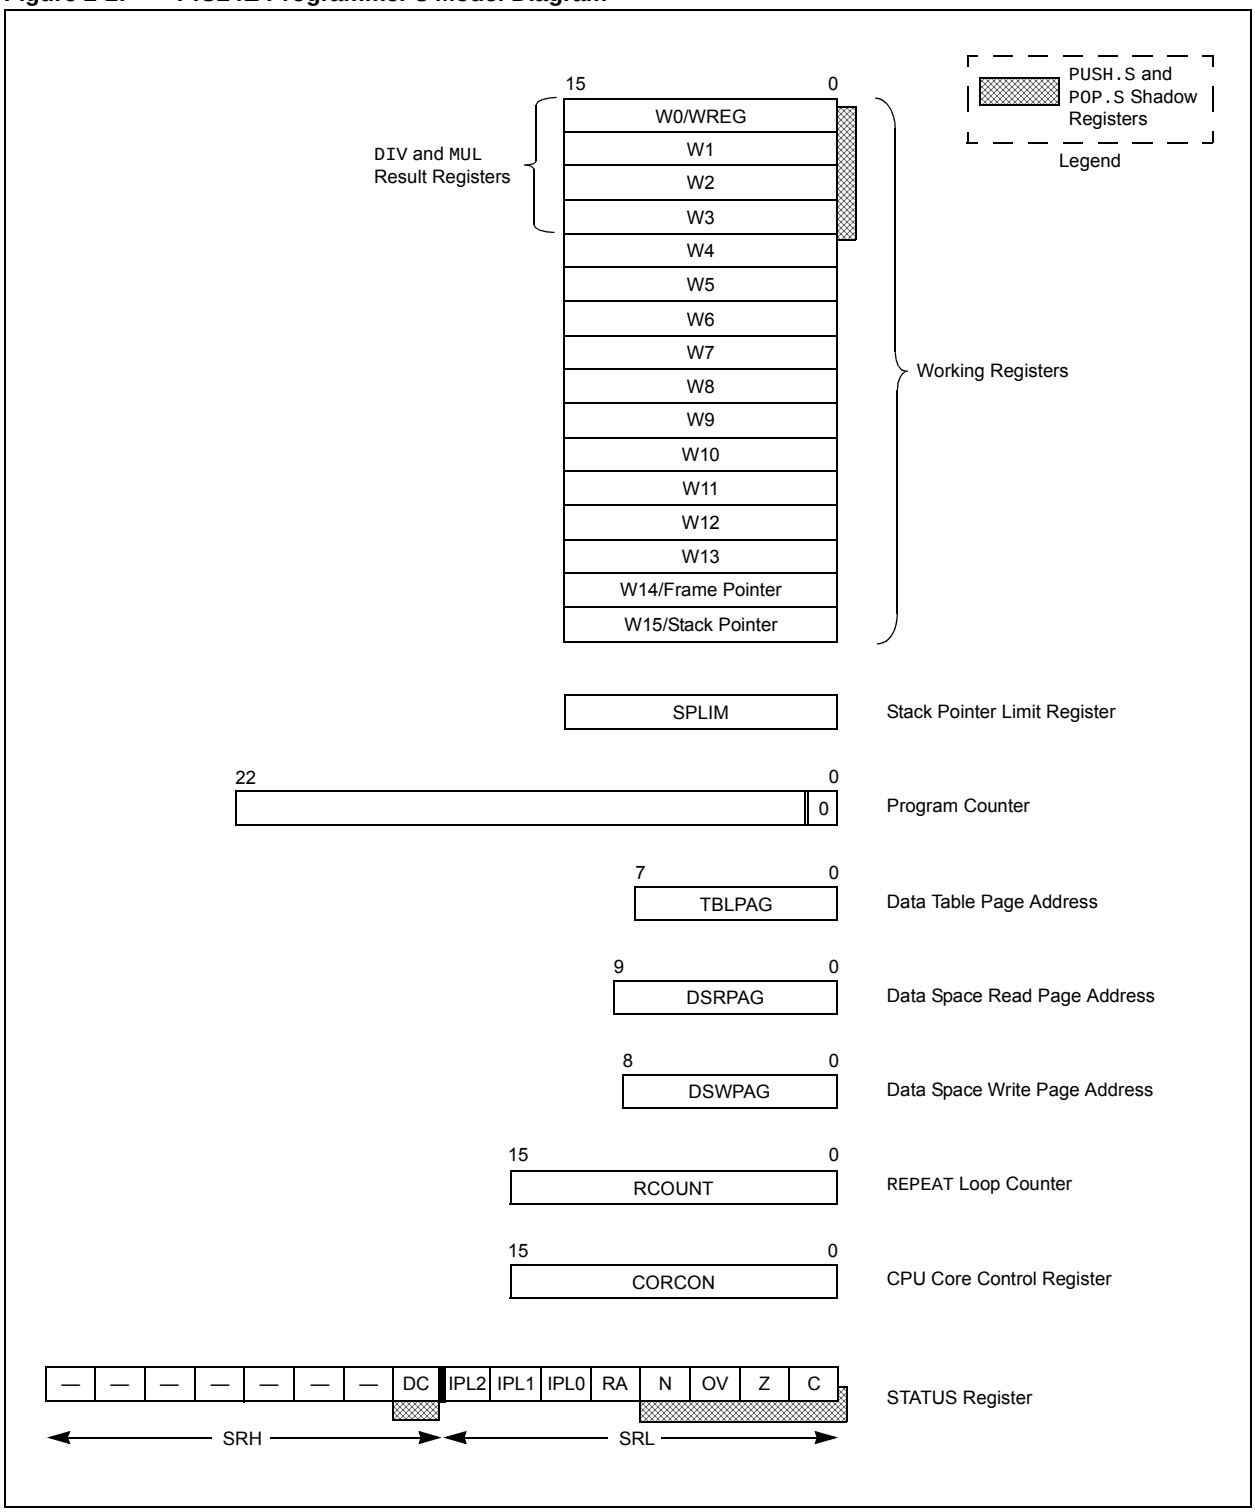


Figure 2-3: dsPIC30F and dsPIC33F Programmer's Model Diagram

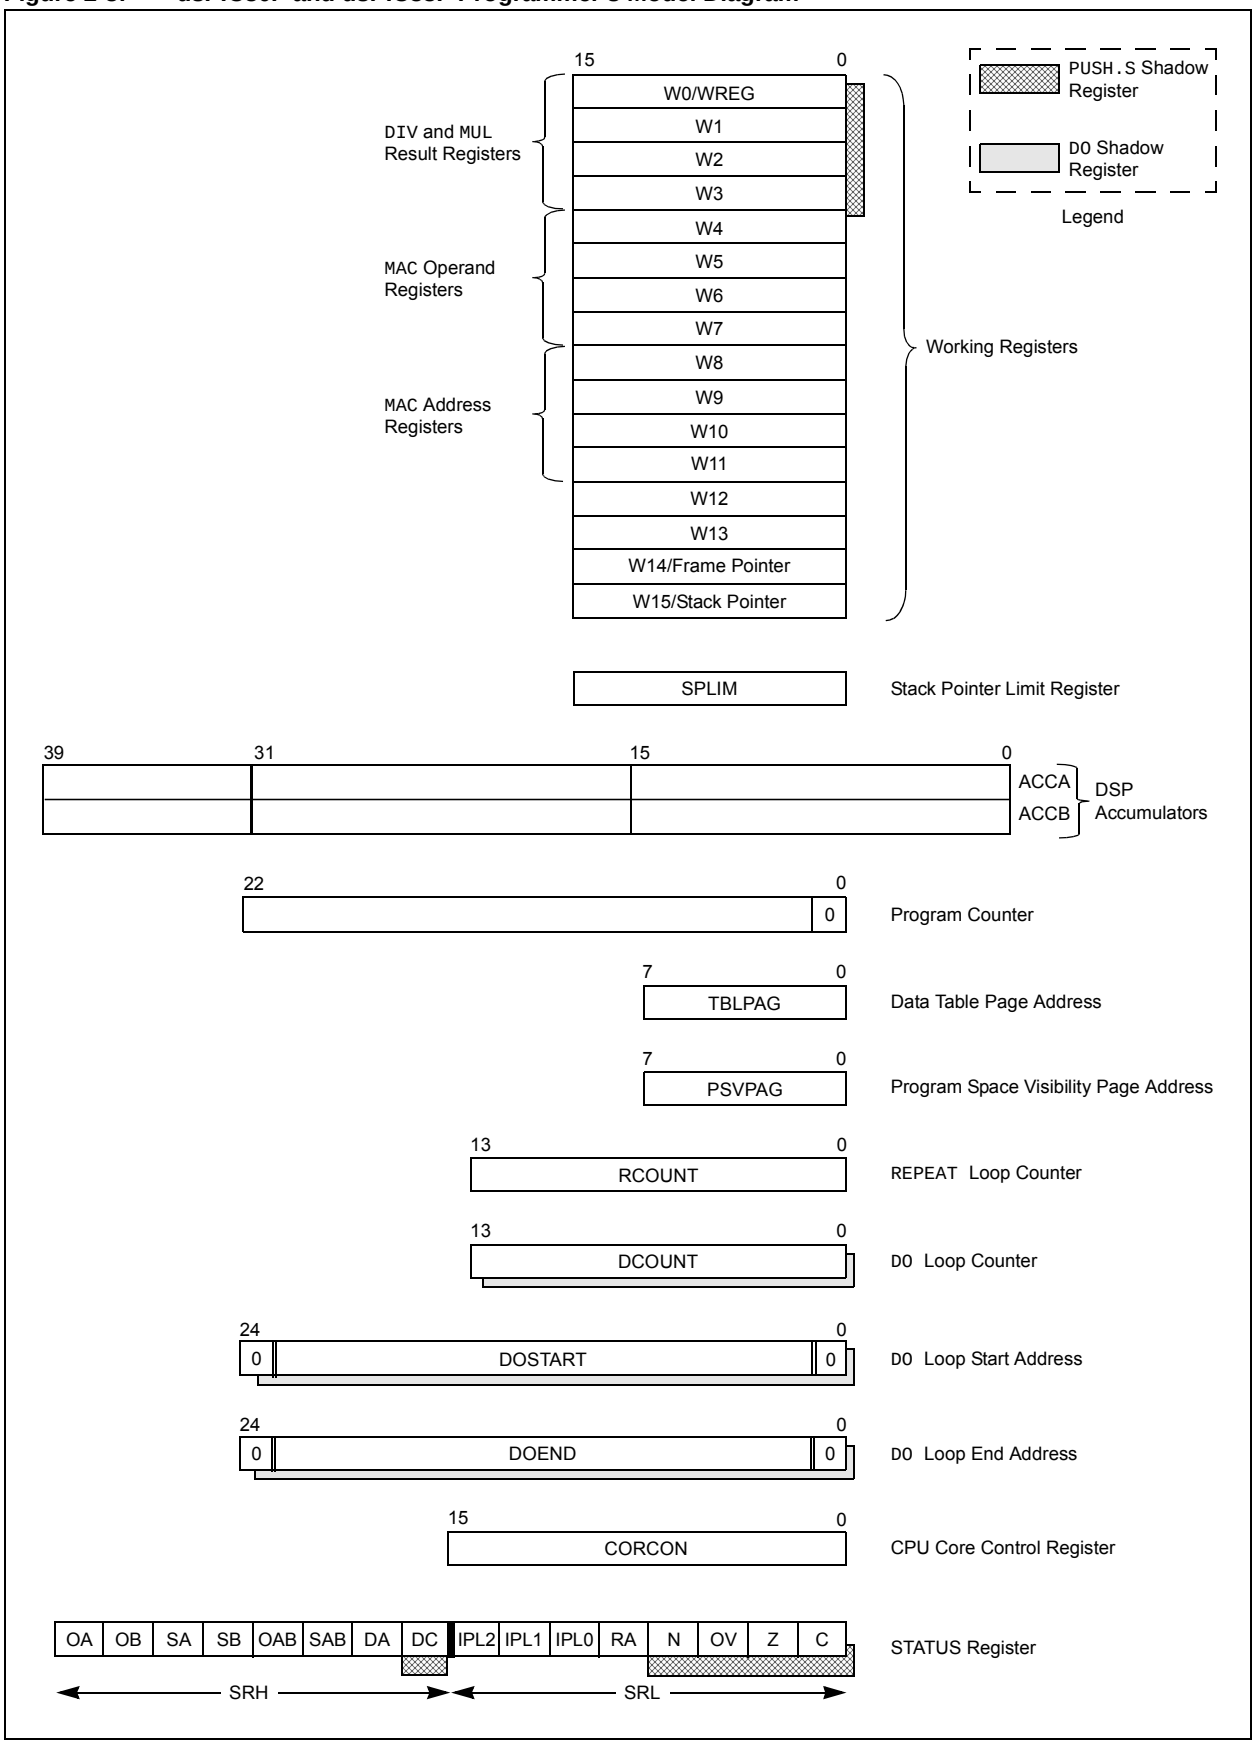
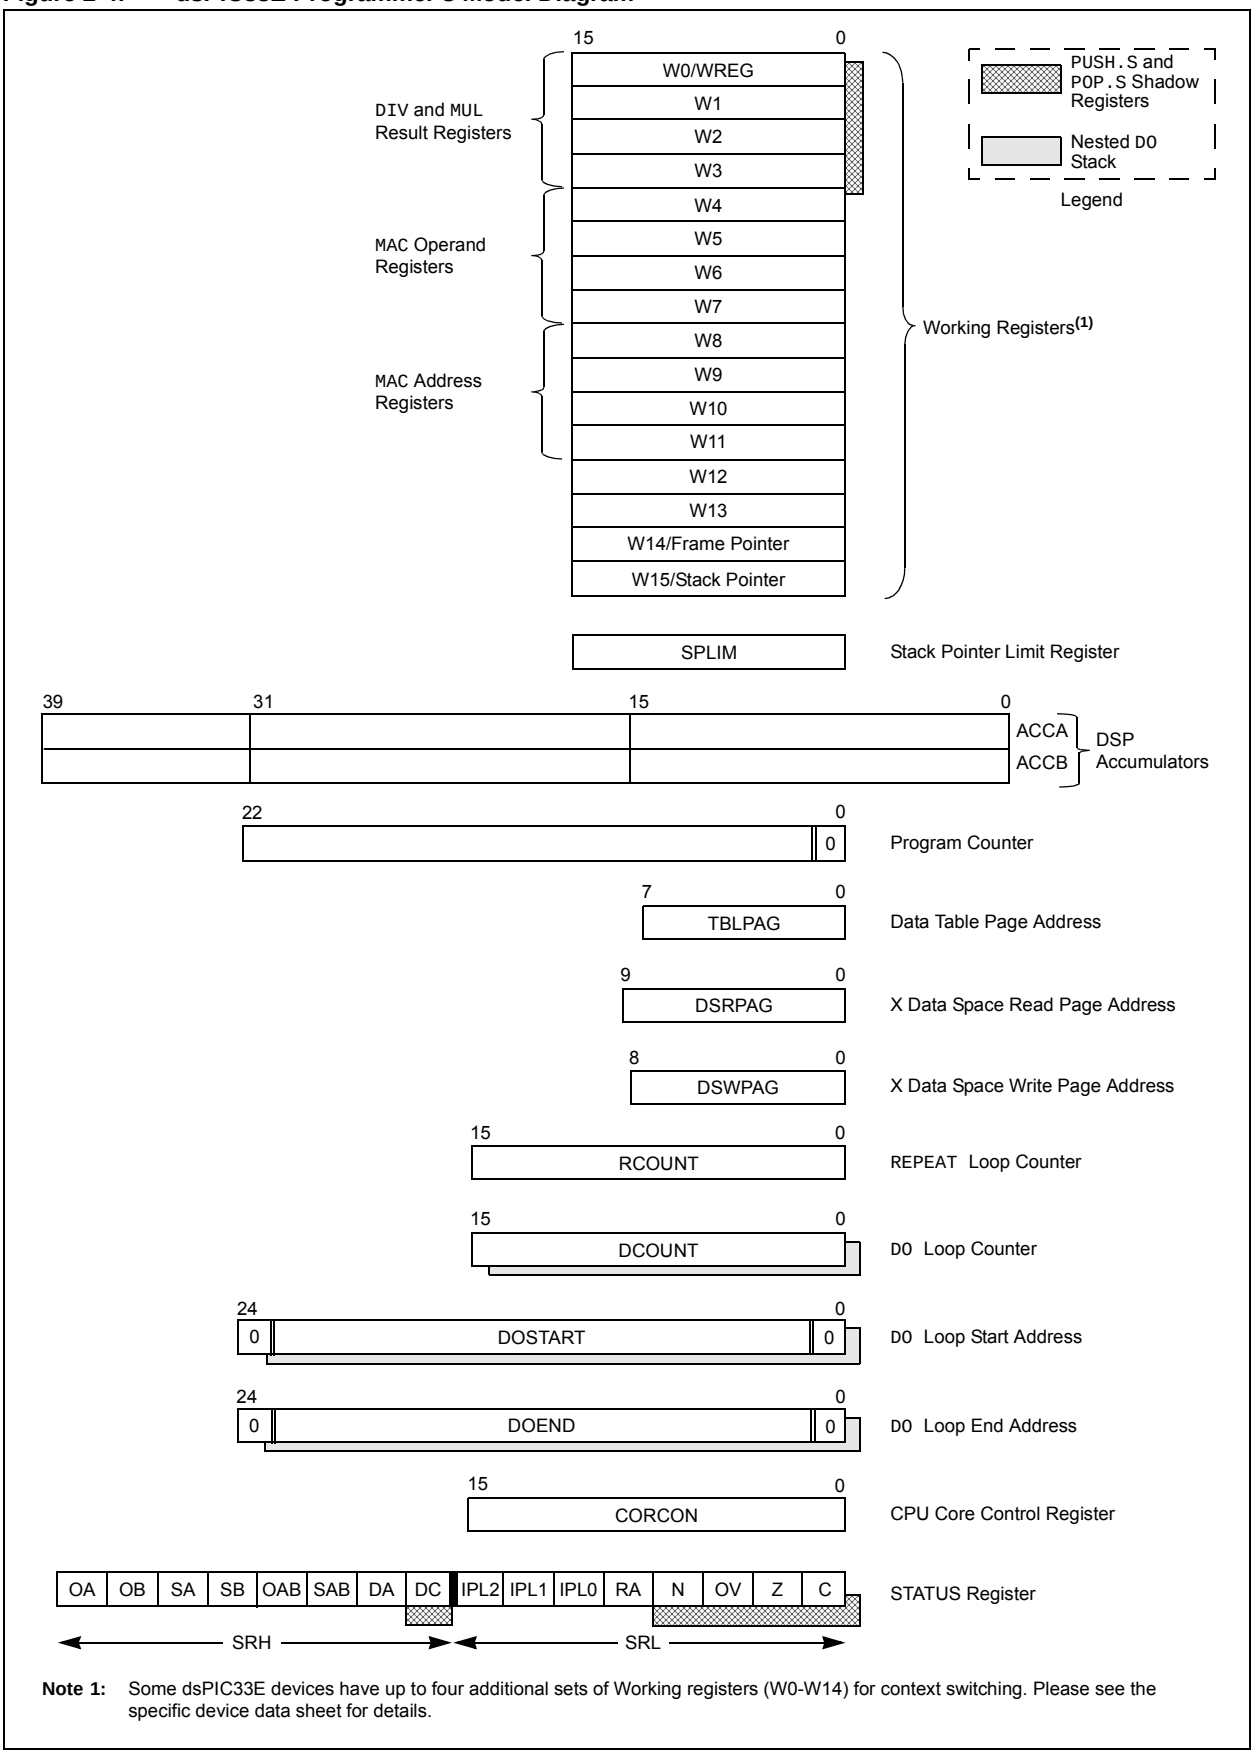


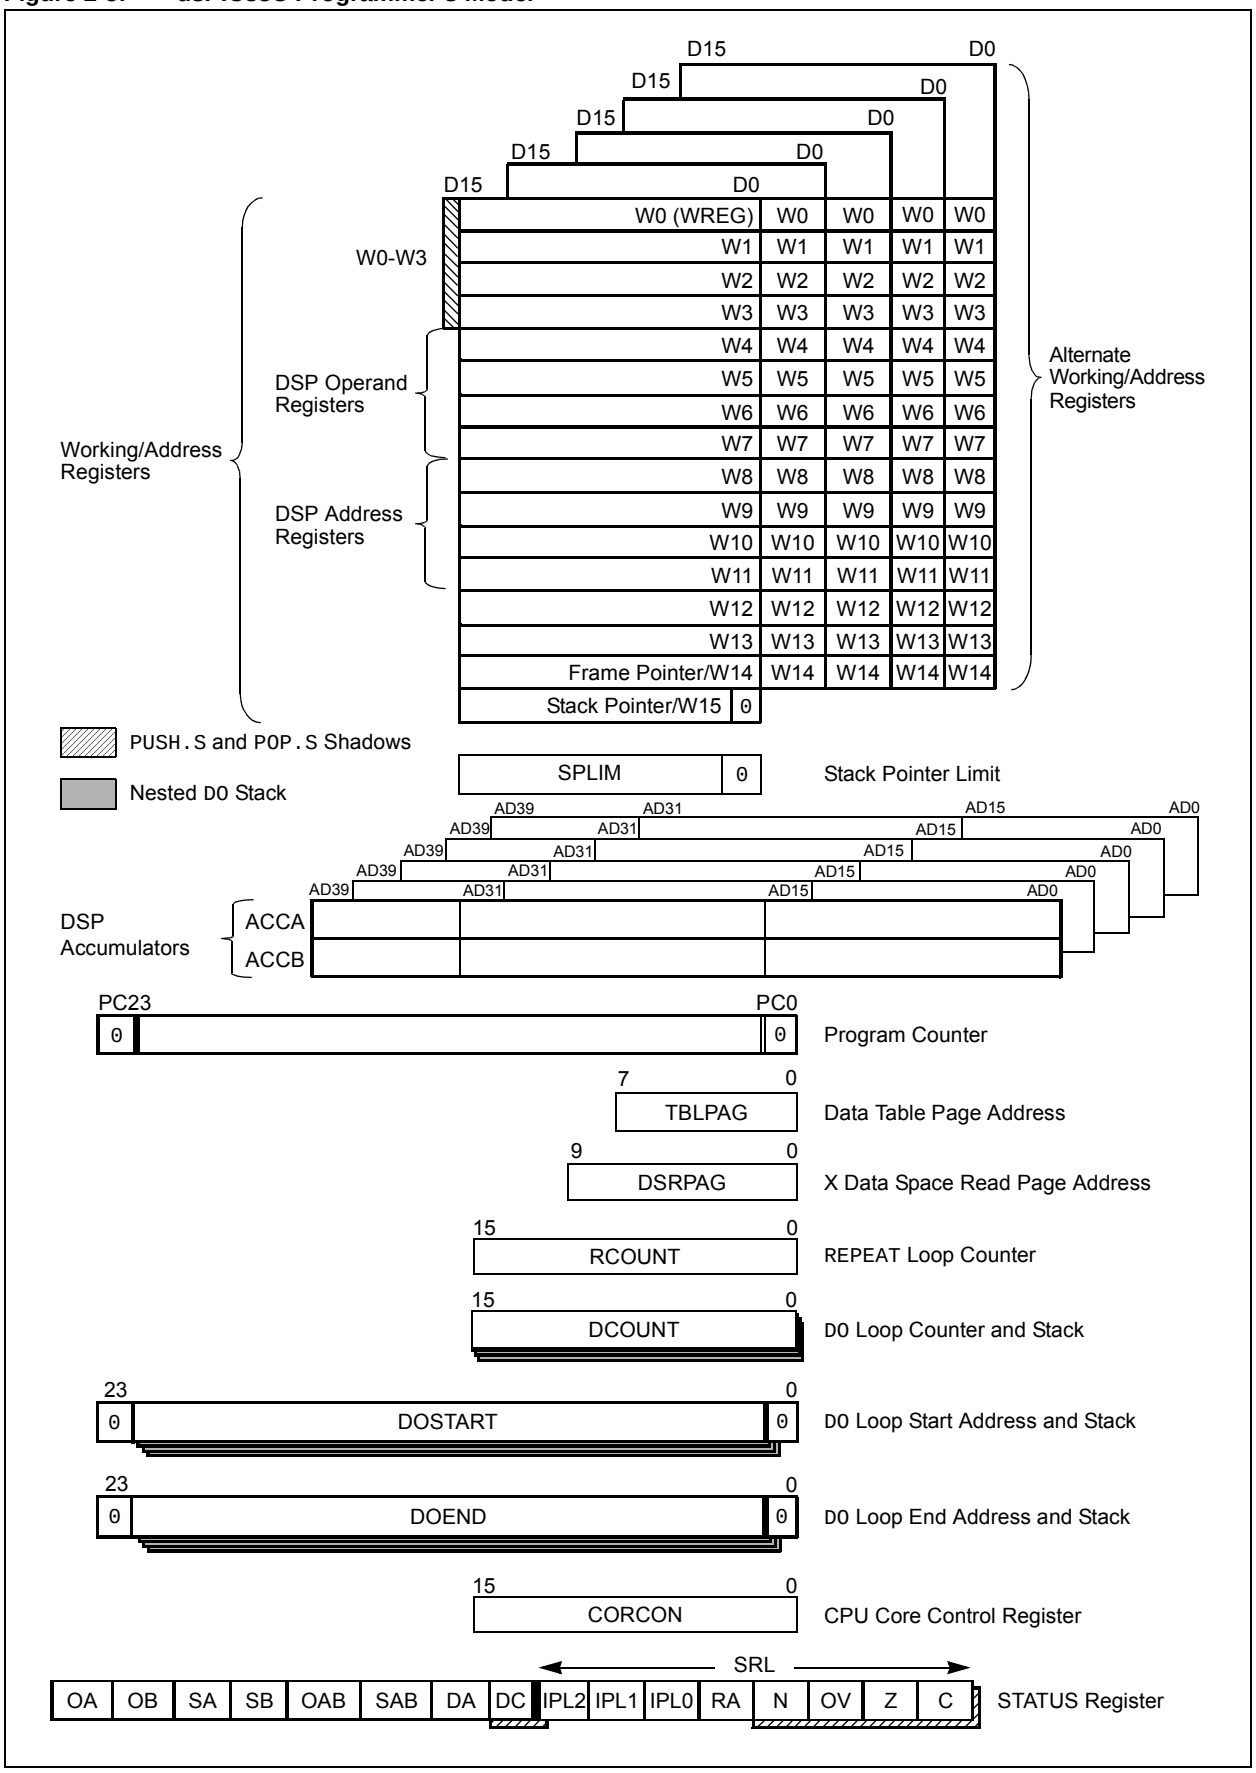
© 2005-2018 Microchip Technology Inc.

Figure 2-4: dsPIC33E Programmer's Model Diagram



Note 1: Some dsPIC33E devices have up to four additional sets of Working registers (W0-W14) for context switching. Please see the specific device data sheet for details.

Figure 2-5: dsPIC33C Programmer's Model



© 2005-2018 Microchip Technology Inc.

All registers in the programmer's model are memory-mapped and can be manipulated directly by the instruction set. A description of each register is provided in Table 2-1.

Note:	Unless otherwise specified, the Programmer's Model register descriptions in Table 2-1 apply to all MCU and DSC device families.

Table 2-1: Programmer's Model Register Descriptions

Register	Description
CORCON	CPU Core Configuration register
PC	23-Bit Program Counter
PSVPAG(1)	Program Space Visibility Page Address register
DSRPAG(2)	Extended Data Space (EDS) Read Page register
DSWPAG(2)	Extended Data Space (EDS) Write Page register
RCOUNT	REPEAT Loop Counter register
SPLIM	Stack Pointer Limit Value register
SR	ALU and DSP Engine STATUS Register
TBLPAG	Table Memory Page Address register
W0-W15(4)	Working register array
ACCA, ACCB(3,5)	40-Bit DSP Accumulators
DCOUNT(3)	DO Loop Counter register
DOSTART(3)	DO Loop Start Address register
DOEND(3)	DO Loop End Address register

Note 1: This register is only available on PIC24F, PIC24H, dsPIC30F and dsPIC33F devices.

2: This register is only available on PIC24E, dsPIC33E and dsPIC33C devices.

3: This register is only available on dsPIC30F, dsPIC33F, dsPIC33E and dsPIC33C devices.

4: dsPIC33C devices and some dsPIC33E devices have up to four additional sets of Working registers for context switching. Please see the device data sheet for details.

5: dsPIC33C devices have up to four additional sets of accumulators for context switching. Please see the device data sheet for details.

2.3 WORKING REGISTER ARRAY

The 16 Working (W) registers can function as data, address or offset registers. The function of a W register is determined by the instruction that accesses it.

Byte instructions, which target the Working register array, only affect the Least Significant Byte (LSB) of the target register. Since the Working registers are memory-mapped, the Least *and* Most Significant Bytes can be manipulated through byte-wide data memory space accesses.

Note:	dsPIC33C devices and some dsPIC33E devices have up to four additional sets of Working registers for context switching. Please see the device data sheet to find out the exact number of register contexts available on a device. The context switching can be performed quickly using the CTXTSWP instruction.

2.4 DEFAULT WORKING REGISTER (WREG)

The instruction set can be divided into two instruction types: Working register instructions and file register instructions. The Working register instructions use the Working register array as data values or as addresses that point to a memory location. In contrast, file register instructions operate on a specific memory address contained in the instruction opcode.

File register instructions that also utilize a Working register do not specify the Working register that is to be used for the instruction. Instead, a default Working register (WREG) is used for these file register instructions. Working register, W0, is assigned to be the WREG. The WREG assignment is not programmable.

2.5 SOFTWARE STACK FRAME POINTER

A frame is a user-defined section of memory in the stack, used by a function to allocate memory for local variables. W14 has been assigned for use as a Stack Frame Pointer with the link (LNK) and unlink (ULNK) instructions. However, if a Stack Frame Pointer and the LNK and ULNK instructions are not used, W14 can be used by any instruction in the same manner as all other W registers. On dsPIC33E, dsPIC33C and PIC24E devices, a Stack Frame Active (SFA) Status bit is used to support nested stack frames. See **Section 4.8.2 "Software Stack Frame Pointer"** for detailed information about the Frame Pointer.

2.6 SOFTWARE STACK POINTER

W15 serves as a dedicated Software Stack Pointer, and will be automatically modified by function calls, exception processing and returns. However, W15 can be referenced by any instruction in the same manner as all other W registers. This simplifies reading, writing and manipulating the Stack Pointer. Refer to **Section 4.8.1 "Software Stack Pointer"** for detailed information about the Stack Pointer.

2.7 STACK POINTER LIMIT REGISTER (SPLIM)

The SPLIM is a 16-bit register associated with the Stack Pointer. It is used to prevent the Stack Pointer from overflowing and accessing memory beyond the user allocated region of stack memory. Refer to **Section 4.8.3 "Stack Pointer Overflow"** for detailed information about the SPLIM.

2.8 ACCUMULATOR A AND ACCUMULATOR B (dsPIC30F, dsPIC33F, dsPIC33E AND dsPIC33C DEVICES)

Accumulator A (ACCA) and Accumulator B (ACCB) are 40-bit wide registers, utilized by DSP instructions to perform mathematical and shifting operations. Each accumulator is composed of three memory-mapped registers:

- AccxU (bits 39-32)
- AccxH (bits 31-16)
- AccxL (bits 15-0)

In dsPIC33E devices, Accumulator A and Accumulator B can also be used as destination registers in MCU MUL.xx instructions. This helps reduce the execution time of extended precision arithmetic operations.

Refer to Figure 4-13 for details on using ACCA and ACCB.

Note:	dsPIC33C devices have up to four additional sets of accumulators for context switching. Please see the device data sheet to find out the exact number of register contexts available on a device. The context switching can be performed quickly using the CTXTSWP instruction.

© 2005-2018 Microchip Technology Inc.

2.9 PROGRAM COUNTER

The Program Counter (PC) is 23 bits wide. Instructions are addressed in the 4M x 24-bit user program memory space by PC<22:1>, where PC<0> is always set to '0' to maintain instruction word alignment and provide compatibility with Data Space Addressing. This means that during normal instruction execution, the PC increments by two.

Program memory, located at 0x800000 and above, is utilized for device configuration data, Unit ID and Device ID. This region is not available for user code execution and the PC cannot access this area. However, one may access this region of memory using table instructions. For details on accessing the configuration data, Unit ID and Device ID, refer to the specific device family reference manual.

2.10 TBLPAG REGISTER

The TBLPAG register is used to hold the upper eight bits of a program memory address during table read and write operations. Table instructions are used to transfer data between program memory space and data memory space. For details on accessing program memory with the table instructions, refer to the family reference manual of the specific device.

2.11 PSVPAG REGISTER (PIC24F, PIC24H, dsPIC30F AND dsPIC33F)

Program Space Visibility (PSV) allows the user to map a 32-Kbyte section of the program memory space into the upper 32 Kbytes of data address space. This feature allows transparent access of constant data through instructions that operate on data memory. The PSVPAG register selects the 32-Kbyte region of program memory space that is mapped to the data address space. For details on Program Space Visibility, refer to the specific device family reference manual.

2.12 RCOUNT REGISTER

The 14-bit RCOUNT register (16-bit for PIC24E, dsPIC33E and dsPIC33C devices) contains the loop counter for the REPEAT instruction. When a REPEAT instruction is executed, RCOUNT is loaded with the repeat count of the instruction, either "lit14" for the "REPEAT #lit14" instruction ("lit15" for the "REPEAT #lit15" instruction for PIC24E, dsPIC33E and dsPIC33C devices) or the 14 LSbs of the Wn register for the "REPEAT Wn" instruction (entire Wn for PIC24E, dsPIC33E and dsPIC33C devices). The REPEAT loop will be executed RCOUNT + 1 time.

Note 1: If a REPEAT loop is executing and gets interrupted, RCOUNT may be cleared by the Interrupt Service Routine (ISR) to break out of the REPEAT loop when the foreground code is re-entered.

2: Refer to the specific device family reference manual for complete details about REPEAT loops.

2.13 DCOUNT REGISTER (dsPIC30F, dsPIC33F, dsPIC33E AND dsPIC33C DEVICES)

The 14-bit DCOUNT register (16-bit for dsPIC33E and dsPIC33C devices) contains the loop counter for hardware DO loops. When a DO instruction is executed, DCOUNT is loaded with the loop count of the instruction, either "lit14" for the "DO #lit14, Expr" instruction ("lit15" for the "DO #lit15, Expr" instruction for dsPIC33E devices) or the 14 LSbs of the Ws register for the "DO Ws, Expr" instruction (entire Wn for dsPIC33E devices). The DO loop will be executed DCOUNT + 1 time.

Note 1: In dsPIC30F and dsPIC33F devices, the DCOUNT register contains a shadow register. See **Section 2.18 "Shadow Registers"** for information on shadow registers.

2: The dsPIC33E devices have a 4-level deep, nested DO stack instead of a shadow register.

3: Refer to the specific device family reference manual for complete details about DO loops.

2.14 DOSTART REGISTER (dsPIC30F, dsPIC33F, dsPIC33E AND dsPIC33C DEVICES)

The DOSTART register contains the starting address for a hardware DO loop. When a DO instruction is executed, DOSTART is loaded with the address of the instruction that follows the DO instruction. This location in memory is the start of the DO loop. When looping is activated, program execution continues with the instruction stored at the DOSTART address after the last instruction in the DO loop is executed. This mechanism allows for zero overhead looping.

Note 1: For dsPIC30F and dsPIC33F devices, DOSTART has a shadow register. See **Section 2.18 "Shadow Registers"** for information on shadowing.

2: The dsPIC33E and dsPIC33C devices have a 4-level deep, nested DO stack instead of a shadow register. The DOSTART register is read-only in dsPIC33E and dsPIC33C devices.

3: Refer to the specific device family reference manual for complete details about DO loops.

2.15 DOEND REGISTER (dsPIC30F, dsPIC33F, dsPIC33E AND dsPIC33C DEVICES)

The DOEND register contains the ending address for a hardware DO loop. When a DO instruction is executed, DOEND is loaded with the address specified by the expression in the DO instruction. This location in memory specifies the last instruction in the DO loop. When looping is activated and the instruction stored at the DOEND address is executed, program execution will continue from the DO loop start address (stored in the DOSTART register).

Note 1: For dsPIC30F and dsPIC33F devices, DOEND has a shadow register. See **Section 2.18 "Shadow Registers"** for information on shadow registers.

2: The dsPIC33E and dsPIC33C devices have a 4-level deep, nested DO stack instead of a shadow register.

3: Refer to the specific device family reference manual for complete details about DO loops.

2.16 STATUS REGISTER

The 16-bit STATUS Register maintains status information for the instructions which have been executed most recently. Operation Status bits exist for MCU operations, loop operations and DSP operations. Additionally, the STATUS Register contains the CPU Interrupt Priority Level bits, IPL<2:0>, which are used for interrupt processing.

Depending on the MCU and DSC family, one of the following STATUS Registers is used:

- Register 2-1 for PIC24F, PIC24H and PIC24E devices
- Register 2-2 for dsPIC30F and dsPIC33F devices
- Register 2-3 for dsPIC33E and dsPIC33C devices

2.16.1 MCU ALU Status Bits

The MCU operation Status bits are either affected or used by the majority of instructions in the instruction set. Most of the logic, math, rotate/shift and bit instructions modify the MCU Status bits after execution, and the conditional branch instructions use the state of individual Status bits to determine the flow of program execution. All conditional branch instructions are listed in **Section 4.9 "Conditional Branch Instructions"**.

The Carry (C), Zero (Z), Overflow (OV), Negative (N) and Digit Carry (DC) bits show the immediate status of the MCU ALU by indicating whether an operation has resulted in a Carry, Zero, Overflow, Negative result or Digit Carry. When a subtract operation is performed, the C flag is used as a $\overline{\text{Borrow}}$ flag.

© 2005-2018 Microchip Technology Inc.

The Z Status bit is useful for extended precision arithmetic. The Z Status bit functions like a normal Z flag for all instructions except those that use a carry or borrow input (ADDC, CPB, SUBB and SUBBR). See **Section 4.10 "Z Status Bit"** for more detailed information.

Note 1:	All MCU bits are shadowed during execution of the PUSH.S instruction and they are restored on execution of the POP.S instruction.
2:	All MCU bits, except the DC flag (which is not in the SRL), are stacked during exception processing (see **Section 4.8.1 "Software Stack Pointer"**).

2.16.2 REPEAT Loop Active (RA) Status Bit

The REPEAT Loop Active bit (RA) is used to indicate when looping is active. The RA flag indicates that a REPEAT instruction is being executed and it is only affected by the REPEAT instructions. The RA flag is set to '1' when the instruction being repeated begins execution and it is cleared when the instruction being repeated completes execution for the last time.

Since the RA flag is also read-only, it may not be directly cleared. However, if a REPEAT or its target instruction is interrupted, the Interrupt Service Routine may clear the RA flag of the SRL, which resides on the stack. This action will disable looping once program execution returns from the Interrupt Service Routine, because the restored RA will be '0'.

2.16.3 DO Loop Active (DA) Status Bit (dsPIC30F, dsPIC33F, dsPIC33E and dsPIC33C Devices)

The DO Loop Active bit (DA) is used to indicate when looping is active. The DO instructions affect the DA flag, which indicates that a DO loop is active. The DA flag is set to '1' when the first instruction of the DO loop is executed and it is cleared when the last instruction of the loop completes final execution.

The DA flag is read-only. This means that looping is not initiated by writing a '1' to DA, nor is it terminated by writing a '0' to DA. If a DO loop must be terminated prematurely, the EDT bit (CORCON<11>) should be used.

2.16.4 DSP ALU Status Bits (dsPIC30F, dsPIC33F, dsPIC33E and dsPIC33C Devices)

The high byte of the STATUS Register (SRH) is used by the DSP class of instructions and it is modified when data passes through one of the adders. The SRH provides status information about overflow and saturation for both accumulators. The Saturate A, Saturate B, Overflow A and Overflow B (SA, SB, OA, OB) bits provide individual accumulator status, while the Saturate AB and Overflow AB (SAB, OAB) bits provide combined accumulator status. The SAB and OAB bits provide an efficient method for the software developer to check the register for saturation or overflow.

The OA and OB bits are used to indicate when an operation has generated an overflow into the guard bits (bits 32 through 39) of the respective accumulator. This condition can only occur when the processor is in Super Saturation mode or if saturation is disabled. It indicates that the operation has generated a number which cannot be represented with the lower 31 bits of the accumulator. The OA and OB bits are writable in dsPIC33E and dsPIC33C devices.

The SA and SB bits are used to indicate when an operation has generated an overflow out of the MSb of the respective accumulator. The SA and SB bits are active, regardless of the Saturation mode (Disabled, Normal or Super) and may be considered "sticky". Namely, once the SA or SB bit is set to '1', it can only be cleared manually by software, regardless of subsequent DSP operations. When it is required, the BCLR instruction can be used to clear the SA or SB bit.

In addition, the SA and SB bits can be set by software in dsPIC33E and dsPIC33C devices, enabling efficient context state switching.

For convenience, the OA and OB bits are logically ORed together to form the OAB flag, and the SA and SB bits are logically ORed to form the SAB flag. These cumulative Status bits provide efficient overflow and saturation checking when an algorithm is implemented. Instead of interrogating the OA and OB bits independently for arithmetic overflows, a single check of OAB can be performed. Likewise, when checking for saturation, SAB may be examined instead of checking both the SA and SB bits. Note that clearing the SAB flag will clear both the SA and SB bits.

© 2005-2018 Microchip Technology Inc.

2.16.5 Interrupt Priority Level Status Bits

The three Interrupt Priority Level (IPL) bits of the SRL (SR<7:5>) and the IPL3 bit (CORCON<3>) set the CPU's IPL, which is used for exception processing. Exceptions consist of interrupts and hardware traps. Interrupts have a user-defined priority level between 0 and 7, while traps have a fixed priority level between 8 and 15. The fourth Interrupt Priority Level bit, IPL3, is a special IPL bit that may only be read or cleared by the user. This bit is only set when a hardware trap is activated and it is cleared after the trap is serviced.

The CPU's IPL identifies the lowest level exception which may interrupt the processor. The interrupt level of a pending exception must always be greater than the CPU's IPL for the CPU to process the exception. This means that if the IPL is 0, all exceptions at Priority Level 1 and above may interrupt the processor. If the IPL is 7, only hardware traps may interrupt the processor.

When an exception is serviced, the IPL is automatically set to the priority level of the exception being serviced, which will disable all exceptions of equal and lower priority. However, since the IPL field is read/write, one may modify the lower three bits of the IPL in an Interrupt Service Routine to control which exceptions may preempt the exception processing. Since the SRL is stacked during exception processing, the original IPL is always restored after the exception is serviced. If required, one may also prevent exceptions from nesting by setting the NSTDIS bit (INTCON1<15>).

Note:	For more detailed information on exception processing, refer to the family reference manual of the specific device.

© 2005-2018 Microchip Technology Inc.

2.17 CORE CONTROL REGISTER

For all MCU and DSC devices, the 16-bit CPU Core Control register (CORCON) is used to set the configuration of the CPU. This register provides the ability to map program space into data space.

In addition to setting CPU modes, the CORCON register contains status information about the IPL<3> Status bit, which indicates if a trap exception is being processed.

Depending on the MCU and DSC family, one of the following CORCON registers is used:

- Register 2-4 for PIC24F and PIC24H devices
- Register 2-5 for PIC24E devices
- Register 2-6 for dsPIC30F and dsPIC33F devices
- Register 2-7 for dsPIC33E and dsPIC33C devices

2.17.1 dsPIC30F, dsPIC33F, dsPIC33E and dsPIC33C Specific Bits

In addition to setting CPU modes, the following features are available through the CORCON register:

- Sets the ACCA and ACCB saturation enable
- Sets the Data Space Write Saturation mode
- Sets the Accumulator Saturation and Rounding modes
- Sets the Multiplier mode for DSP operations
- Terminates DO loops prematurely
- Provides status information about the DO loop nesting level (DL<2:0>)
- Selects fixed or variable interrupt latency (dsPIC33E and dsPIC33C only)

2.17.1.1 PIC24E, dsPIC33E AND dsPIC33C SPECIFIC BITS

A Status bit (SFA) is available that indicates whether the stack frame is active.

Note:	PIC24E, dsPIC33E and dsPIC33C devices do not have a PSV control bit; it has been replaced by the SFA bit.

2.18 SHADOW REGISTERS

A shadow register is used as a temporary holding register and can transfer its contents to or from the associated host register when instructed. Some of the registers in the programmer's model have a shadow register, which is utilized during the execution of a DO, POP.S or PUSH.S instruction. Shadow register usage is shown in Table 2-2.

Note:	The DO instruction is only available in dsPIC30F, dsPIC33F, dsPIC33E and dsPIC33C devices.

Table 2-2: Automatic Shadow Register Usage

Location	DO(1)	POP.S/PUSH.S
DCOUNT(1)	Yes	—
DOSTART(1)	Yes	—
DOEND(1)	Yes	—
STATUS Register – DC, N, OV, Z and C bits	—	Yes
W0-W3	—	Yes

Note 1: The DO Shadow registers are only available in dsPIC30F and dsPIC33F devices.

For dsPIC30F and dsPIC33F devices, since the DCOUNT, DOSTART and DOEND registers are shadowed, the ability to nest DO loops without additional overhead is provided. Since all shadow registers are one register deep, up to one level of DO loop nesting is possible. Further nesting of DO loops is possible in software, with support provided by the DO Loop Nesting Level Status bits (DL<2:0>) in the CORCON register (CORCON<10:8>).

Note:	All shadow registers are one register deep and not directly accessible. Additional shadowing may be performed in software using the software stack.

© 2005-2018 Microchip Technology Inc.

2.19 DO STACK (dsPIC33E AND dsPIC33C DEVICES)

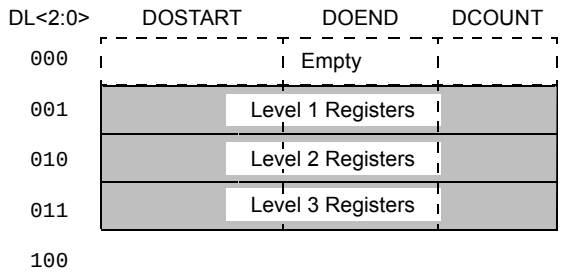
The DO stack is used to preserve the following elements associated with a DO loop underway when another DO loop is encountered (i.e., a nested DO loop).

- DOSTART register value
- DOEND register value
- DCOUNT register value

Note that the DO Level Status field (DL<2:0>) also acts as a pointer to address the DO stack. After the DO instruction is executed, the DO Level Status field (DL<2:0>) points to the next free entry.

The DOSTART, DOEND, and DCOUNT registers each have an associated hardware stack that allows the DO loop hardware to support up to three levels of nesting. A conceptual representation of the DO stack is shown in Figure 2-6.

Figure 2-6: DO Stack Conceptual Diagram



Note 1: For DO register entries, DL<2:0> bits represent the value before the DO stack is executed.
2: For DO instruction buffer entries, DL<2:0> bits represent the value after the DO stack is executed.
3: If DL<2:0> = 000, no DO loops are active (DA = 0).

© 2005-2018 Microchip Technology Inc.

Register 2-1: SR: CPU STATUS Register (PIC24H, PIC24F and PIC24E Devices)

U-0	U-0	U-0	U-0	U-0	U-0	U-0	R/W-0
—	—	—	—	—	—	—	DC
bit 15							bit 8

R/W-0	R/W-0	R/W-0	R-0	R/W-0	R/W-0	R/W-0	R/W-0
IPL2(1,2)	IPL1(1,2)	IPL0(1,2)	RA	N	OV	Z	C
bit 7							bit 0

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 15-9 **Unimplemented:** Read as '0'

bit 8 **DC:** MCU ALU Half Carry/Borrow bit
1 = A carry-out from the 4th low-order bit (for byte-sized data) or 8th low-order bit (for word-sized data) of the result occurred
0 = No carry-out from the 4th low-order bit (for byte-sized data) or 8th low-order bit (for word-sized data) of the result occurred

bit 7-5 **IPL<2:0>:** CPU Interrupt Priority Level Status bits(1,2)
111 = CPU Interrupt Priority Level is 7 (15); user interrupts are disabled
110 = CPU Interrupt Priority Level is 6 (14)
101 = CPU Interrupt Priority Level is 5 (13)
100 = CPU Interrupt Priority Level is 4 (12)
011 = CPU Interrupt Priority Level is 3 (11)
010 = CPU Interrupt Priority Level is 2 (10)
001 = CPU Interrupt Priority Level is 1 (9)
000 = CPU Interrupt Priority Level is 0 (8)

bit 4 **RA:** REPEAT Loop Active bit
1 = REPEAT loop is in progress
0 = REPEAT loop is not in progress

bit 3 **N:** MCU ALU Negative bit
1 = Result was negative
0 = Result was non-negative (zero or positive)

bit 2 **OV:** MCU ALU Overflow bit
This bit is used for signed arithmetic (2's complement). It indicates an overflow of the magnitude that causes the sign bit to change state.
1 = Overflow occurred for signed arithmetic (in this arithmetic operation)
0 = No overflow occurred

bit 1 **Z:** MCU ALU Zero bit
1 = An operation that affects the Z bit has set it at some time in the past
0 = The most recent operation that affects the Z bit has cleared it (i.e., a non-zero result)

bit 0 **C:** MCU ALU Carry/Borrow bit
1 = A carry-out from the MSb occurred
0 = No carry-out from the MSb occurred

Note 1: The IPL<2:0> bits are concatenated with the IPL3 bit (CORCON<3>) to form the CPU Interrupt Priority Level. The value in parentheses indicates the IPL, if IPL3 = 1. User interrupts are disabled when IPL<3> = 1.

2: The IPL<2:0> Status bits are read-only when the NSTDIS bit (INTCON1<15>) = 1. Refer to the family reference manual of the specific device family to see the associated interrupt register.

© 2005-2018 Microchip Technology Inc.

Register 2-2: SR: CPU STATUS Register (dsPIC30F and dsPIC33F Devices)

R-0	R-0	R/C-0	R/C-0	R-0	R/C-0	R-0	R/W-0
OA	OB	SA(1,2)	SB(1,2)	OAB	SAB(1,2,3)	DA(4)	DC
bit 15							bit 8

R/W-0	R/W-0	R/W-0	R-0	R/W-0	R/W-0	R/W-0	R/W-0
IPL2(5)	IPL1(5)	IPL0(5)	RA	N	OV	Z	C
bit 7							bit 0

Legend:	C = Clearable bit		
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 15 **OA:** Accumulator A Overflow bit
1 = Accumulator A overflowed
0 = Accumulator A has not overflowed

bit 14 **OB:** Accumulator B Overflow bit
1 = Accumulator B overflowed
0 = Accumulator B has not overflowed

bit 13 **SA:** Accumulator A Saturation bit(1,2)
1 = Accumulator A is saturated or has been saturated since this bit was last cleared
0 = Accumulator A is not saturated

bit 12 **SB:** Accumulator B Saturation bit(1,2)
1 = Accumulator B is saturated or has been saturated at since this bit was last cleared
0 = Accumulator B is not saturated

bit 11 **OAB:** OA || OB Combined Accumulator Overflow bit
1 = Accumulator A or B has overflowed
0 = Neither Accumulator A nor B has overflowed

bit 10 **SAB:** SA || SB Combined Accumulator bit(1,2,3)
1 = Accumulator A or B is saturated or has been saturated since this bit was last cleared
0 = Neither Accumulator A nor B is saturated

bit 9 **DA:** DO Loop Active bit(4)
1 = DO loop is in progress
0 = DO loop is not in progress

bit 8 **DC:** MCU ALU Half Carry bit
1 = A carry-out from the MSb of the lower nibble occurred
0 = No carry-out from the MSb of the lower nibble occurred

Note 1: This bit may be read or cleared, but not set.
2: Once this bit is set, it must be cleared manually by software.
3: Clearing this bit will clear SA and SB.
4: This bit is read-only.
5: The IPL<2:0> bits are concatenated with the IPL3 bit (CORCON<3>) to form the CPU Interrupt Priority Level. The value in parentheses indicates the IPL, if IPL3 = 1.

Register 2-2: SR: CPU STATUS Register (dsPIC30F and dsPIC33F Devices) (Continued)

bit 7-5 **IPL<2:0>:** Interrupt Priority Level bits(5)
111 = CPU Interrupt Priority Level is 7 (15); user interrupts are disabled
110 = CPU Interrupt Priority Level is 6 (14)
101 = CPU Interrupt Priority Level is 5 (13)
100 = CPU Interrupt Priority Level is 4 (12)
011 = CPU Interrupt Priority Level is 3 (11)
010 = CPU Interrupt Priority Level is 2 (10)
001 = CPU Interrupt Priority Level is 1 (9)
000 = CPU Interrupt Priority Level is 0 (8)

bit 4 **RA:** REPEAT Loop Active bit
1 = REPEAT loop is in progress
0 = REPEAT loop is not in progress

bit 3 **N:** MCU ALU Negative bit
1 = The result of the operation was negative
0 = The result of the operation was not negative

bit 2 **OV:** MCU ALU Overflow bit
1 = Overflow occurred
0 = No overflow occurred

bit 1 **Z:** MCU ALU Zero bit
1 = The result of the operation was zero
0 = The result of the operation was not zero

bit 0 **C:** MCU ALU Carry/$\overline{\text{Borrow}}$ bit
1 = A carry-out from the MSb occurred
0 = No carry-out from the MSb occurred

Note 1: This bit may be read or cleared, but not set.
2: Once this bit is set, it must be cleared manually by software.
3: Clearing this bit will clear SA and SB.
4: This bit is read-only.
5: The IPL<2:0> bits are concatenated with the IPL3 bit (CORCON<3>) to form the CPU Interrupt Priority Level. The value in parentheses indicates the IPL, if IPL3 = 1.

Register 2-3: SR: CPU STATUS Register (dsPIC33E and dsPIC33C Devices)

R/W-0	R/W-0	R/W-0	R/W-0	R/C-0	R/C-0	R-0	R/W-0

bit 15 **OA:** Accumulator A Overflow Status bit
1 = Accumulator A has overflowed
0 = Accumulator A has not overflowed

bit 14 **OB:** Accumulator B Overflow Status bit
1 = Accumulator B has overflowed
0 = Accumulator B has not overflowed

bit 13 **SA:** Accumulator A Saturation Status bit(3)
1 = Accumulator A is saturated or has been saturated since this bit was last cleared
0 = Accumulator A is not saturated

bit 12 **SB:** Accumulator B Saturation Status bit(3)
1 = Accumulator B is saturated or has been saturated since this bit was last cleared
0 = Accumulator B is not saturated

bit 11 **OAB:** OA || OB Combined Accumulator Overflow Status bit
1 = Accumulator A or B has overflowed
0 = Neither Accumulator A nor B has overflowed

bit 10 **SAB:** SA || SB Combined Accumulator Status bit
1 = Accumulator A or B is saturated or has been saturated since this bit was last cleared
0 = Neither Accumulator A nor B is saturated

bit 9 **DA:** DO Loop Active bit
1 = DO loop is in progress
0 = DO loop is not in progress

bit 8 **DC:** MCU ALU Half Carry/$\overline{\text{Borrow}}$ bit
1 = A carry-out from the 4th low-order bit (for byte-sized data) or 8th low-order bit (for word-sized data) of the result occurred
0 = No carry-out from the 4th low-order bit (for byte-sized data) or 8th low-order bit (for word-sized data) of the result occurred

Note 1: The IPL<2:0> bits are concatenated with the IPL3 bit (CORCON<3>) to form the CPU Interrupt Priority Level. The value in parentheses indicates the IPL, if IPL3 = 1. User interrupts are disabled when IPL3 = 1.

2: The IPL<2:0> Status bits are read-only when the NSTDIS bit (INTCON1<15>) = 1. Refer to the family reference manual of the specific device family to see the associated interrupt register.

3: A data write to SR can modify the SA or SB bits by either a data write to SA and SB or by clearing the SAB bit. To avoid a possible SA/SB bit write race condition, the SA and SB bits should not be modified using bit operations.

© 2005-2018 Microchip Technology Inc.

Register 2-3: SR: CPU STATUS Register (dsPIC33E and dsPIC33C Devices) (Continued)

bit 7-5 **IPL<2:0>:** CPU Interrupt Priority Level Status bits(1,2)
111 = CPU Interrupt Priority Level is 7 (15); user interrupts are disabled
110 = CPU Interrupt Priority Level is 6 (14)
101 = CPU Interrupt Priority Level is 5 (13)
100 = CPU Interrupt Priority Level is 4 (12)
011 = CPU Interrupt Priority Level is 3 (11)
010 = CPU Interrupt Priority Level is 2 (10)
001 = CPU Interrupt Priority Level is 1 (9)
000 = CPU Interrupt Priority Level is 0 (8)

bit 4 **RA:** REPEAT Loop Active bit
1 = REPEAT loop is in progress
0 = REPEAT loop is not in progress

bit 3 **N:** MCU ALU Negative bit
1 = Result was negative
0 = Result was non-negative (zero or positive)

bit 2 **OV:** MCU ALU Overflow bit
This bit is used for signed arithmetic (2's complement). It indicates an overflow of the magnitude that causes the sign bit to change state.
1 = Overflow occurred for signed arithmetic (in this arithmetic operation)
0 = No overflow occurred

bit 1 **Z:** MCU ALU Zero bit
1 = The result of the operation was zero
0 = The result of the operation was not zero

bit 0 **C:** MCU ALU Carry/$\overline{\text{Borrow}}$ bit
1 = A carry-out from the MSb of the result occurred
0 = No carry-out from the MSb of the result occurred

Note 1: The IPL<2:0> bits are concatenated with the IPL3 bit (CORCON<3>) to form the CPU Interrupt Priority Level. The value in parentheses indicates the IPL, if IPL3 = 1. User interrupts are disabled when IPL3 = 1.

2: The IPL<2:0> Status bits are read-only when the NSTDIS bit (INTCON1<15>) = 1. Refer to the family reference manual of the specific device family to see the associated interrupt register.

3: A data write to SR can modify the SA or SB bits by either a data write to SA and SB or by clearing the SAB bit. To avoid a possible SA/SB bit write race condition, the SA and SB bits should not be modified using bit operations.

Section 3. Instruction Set Overview

HIGHLIGHTS

This section of the manual contains the following major topics:

3.1 Introduction 40
3.2 Instruction Set Overview 40
3.3 Instruction Set Summary Tables 42

© 2005-2018 Microchip Technology Inc.

3.1 INTRODUCTION

The 16-bit MCU and DSC instruction set provides a broad suite of instructions that support traditional microcontroller applications and a class of instructions that support math-intensive applications. Since almost all of the functionality of the 8-bit PIC® MCU instruction set has been maintained, this hybrid instruction set allows an easy 16-bit migration path for users already familiar with the PIC microcontroller.

3.2 INSTRUCTION SET OVERVIEW

Depending on the device family, the 16-bit MCU and DSC instruction set contains up to 105 instructions, which can be grouped into the functional categories shown in Table 3-1. Table 1-2 defines the symbols used in the instruction summary tables. Table 3-2 through Table 3-11 define the syntax, description, storage and execution requirements for each instruction. Storage requirements are represented in 24-bit instruction words and execution requirements are represented in instruction cycles.

Table 3-1: Instruction Groups

Functional Group	Summary Table	Page Number
Move Instructions	Table 3-2	42
Math Instructions	Table 3-3	43
Logic Instructions	Table 3-4	45
Rotate/Shift Instructions	Table 3-5	46
Bit Instructions	Table 3-6	47
Compare/Skip and Compare/Branch Instructions	Table 3-7	48
Program Flow Instructions	Table 3-8	49
Shadow/Stack Instructions	Table 3-9	51
Control Instructions	Table 3-10	51
DSP Instructions(1)	Table 3-11	52

Note 1: DSP instructions are only available in the dsPIC30F, dsPIC33F, dsPIC33E and dsPIC33C device families.

Most instructions have several different addressing modes and execution flows, which require different instruction variants. For instance, depending on the device family, there are up to six unique ADD instructions and each instruction variant has its own instruction encoding. Instruction format descriptions and specific instruction operation are provided in **Section 5. "Instruction Descriptions"**. Additionally, a composite alphabetized instruction set table is provided in **Section 7. "Reference"**.

© 2005-2018 Microchip Technology Inc.

3.2.1 Multicycle Instructions

As shown in the instruction summary tables, most instructions execute in a single cycle with the following exceptions:

Note:	The DO and DIVF instructions are only available in the dsPIC30F, dsPIC33F, dsPIC33E and dsPIC33C device families.

- Instructions, DO, MOV.D, POP.D, PUSH.D, TBLRDH, TBLRDL, TBLWTH and TBLWTL, require two cycles to execute.
- Instructions, DIV.S, DIV.U and DIVF, are single-cycle instructions, which should be executed 18 consecutive times as the target of a REPEAT instruction.
- Instructions that change the Program Counter also require two cycles to execute, with the extra cycle executed as a NOP. Compare/Skip instructions, which skip over a two-word instruction, require three instruction cycles to execute, with two cycles executed as a NOP. Compare/Branch instructions (dsPIC33E/dsPIC33C/PIC24E devices only) require five instruction cycles to execute when the branch is taken.
- The RETFIE, RETLW and RETURN are a special case of an instruction that changes the Program Counter. These execute in three cycles, unless an exception is pending, and then they execute in two cycles.

Note 1:	Instructions which access program memory as data, using Program Space Visibility (PSV), will incur a one or two-cycle delay for PIC24F, PIC24H, dsPIC30F and dsPIC33F devices, whereas using PSV in dsPIC33E and PIC24E devices incurs a four-cycle delay based on Flash memory access time. However, regardless of which device is being used, when the target instruction of a REPEAT loop accesses program memory as data, only the first execution of the target instruction is subject to the delay. See the specific device family reference manual for details.
2:	All instructions may incur an additional delay on some device families depending on Flash memory access time. For example, PIC24E, dsPIC33E and dsPIC33C devices have a three-cycle Flash memory access time. However, instruction pipelining increases the effective instruction execution throughput. Refer to **"CPU"** in the *"dsPIC33/PIC24 Family Reference Manual"* for details on instruction timing.
3:	All read and Read-Modify-Write (RMW) operations (including bit operations) on non-CPU Special Function Registers (e.g., I/O Port, Peripheral Control or STATUS Registers; interrupt flags, etc.) in PIC24E, dsPIC33E and dsPIC33C devices require two instruction cycles to execute. However, all write operations on both CPU and non-CPU Special Function Registers, and all read and Read-Modify-Write operations on CPU Special Function Registers, require one instruction cycle.

3.2.2 Multiword Instructions

As defined by Table 3-2, almost all instructions consume one instruction word (24 bits), with the exception of the CALL, DO and GOTO instructions, which are program flow Instructions listed in Table 3-8. These instructions require two words of memory because their opcodes embed large literal operands.

3.3 INSTRUCTION SET SUMMARY TABLES

Table 3-2: Move Instructions

Assembly Syntax		Description	Words	Cycles	Page Number
EXCH	Wns,Wnd	Swap Wns and Wnd	1	1	254
LDSLV	Wns,Wnd,#lit2(5)	Move a single instruction word from Master to Slave PRAM	1	1	279
MOV	f {,WREG}(1)	Move f to destination	1	1	299
MOV	WREG,f	Move WREG to f	1	1	300
MOV	f,Wnd	Move f to Wnd	1	1(4)	301
MOV	Wns,f	Move Wns to f	1	1	302
MOV.B	#lit8,Wnd	Move 8-bit literal to Wnd	1	1	303
MOV	#lit16,Wnd	Move 16-bit literal to Wnd	1	1	304
MOV	[Ws+Slit10],Wnd	Move [Ws with offset] to Wnd	1	1(4)	305
MOV	Wns,[Wd+Slit10]	Move Wns to [Wd with offset]	1	1	306
MOV	Ws,Wd	Move Ws to Wd	1	1(4)	307
MOV.D	Wns,Wnd	Move double Wns to Wnd:Wnd + 1	1	2(4)	309
MOV.D	Ws,Wnd	Move double Ws:Ws + 1 to Wnd	1	2(4)	309
MOVPAG	#lit10,DSRPAG(2)	Move 10-bit literal to DSRPAG	1	1	311
MOVPAG	#lit9,DSWPAG(2)	Move 9-bit literal to DSWPAG	1	1	311
MOVPAG	#lit8,TBLPAG(2)	Move 8-bit literal to TBLPAG	1	1	311
MOVPAG	Wn, DSRPAG(2)	Move Wn to DSRPAG	1	1	312
SWAP	Wn	Wn = byte or nibble swap Wn	1	1	439
TBLRDH	[Ws],Wd	Read high program word to Wd	1	2(3)	440
TBLRDL	[Ws],Wd	Read low program word to Wd	1	2(3)	442
TBLWTH	Ws,[Wd]	Write Ws to high program word	1	2(4)	444
TBLWTL	Ws,[Wd]	Write Ws to low program word	1	2(4)	446
VFSLV	Wns,Wnd,#lit2(5)	Verify Slave processor program RAM	1	1	450

Note 1: When the optional {,WREG} operand is specified, the destination of the instruction is WREG. When {,WREG} is not specified, the destination of the instruction is the file register f.

2: The MOVPAG instruction is only available in PIC24E, dsPIC33E and dsPIC33C devices.

3: In dsPIC33E and PIC24E devices, and in dsPIC33C Master cores, these instructions require three additional cycles – compared to dsPIC30F, dsPIC33F, PIC24F and PIC24H devices and in dsPIC33C Slave cores.

4: In dsPIC33E, dsPIC33C and PIC24E devices, read and Read-Modify-Write operations on non-CPU Special Function Registers require an additional cycle when compared to dsPIC30F, dsPIC33F, PIC24F and PIC24H devices.

5: These instructions are only available in dsPIC33C devices.

Table 3-3: Math Instructions

Assembly Syntax		Description	Words	Cycles	Page Number
ADD	f {,WREG}[1]	Destination = f + WREG	1	1[5]	102
ADD	#lit10,Wn	Wn = lit10 + Wn	1	1	103
ADD	Wb,#lit5,Wd	Wd = Wb + lit5	1	1	104
ADD	Wb,Ws,Wd	Wd = Wb + Ws	1	1[5]	105
ADDC	f {,WREG}[1]	Destination = f + WREG + (C)	1	1[5]	110
ADDC	#lit10,Wn	Wn = lit10 + Wn + (C)	1	1	111
ADDC	Wb,#lit5,Wd	Wd = Wb + lit5 + (C)	1	1	112
ADDC	Wb,Ws,Wd	Wd = Wb + Ws + (C)	1	1[5]	114
DAW.B	Wn	Wn = decimal adjust Wn	1	1	225
DEC	f {,WREG}[1]	Destination = f – 1	1	1[5]	226
DEC	Ws,Wd	Wd = Ws – 1	1	1[5]	227
DEC2	f {,WREG}[1]	Destination = f – 2	1	1[5]	229
DEC2	Ws,Wd	Wd = Ws – 2	1	1[5]	230
DIV.S	Wm,Wn	Signed 16/16-bit integer divide, Q → W0, R → W1	1	18/6[2]	233
DIV.U	Wm,Wn	Unsigned 16/16-bit integer divide, Q – W0, R → W1	1	18/6[2]	235
DIVF	Wm,Wn	Signed 16/16-bit fractional divide, Q – W0, R → W1	1	18/6[2]	236
DIVF2	Wm,Wn[6]	Signed 16/16-bit fractional divide (W1:W0 preserved)	1	6	238
DIV2.S	Wm,Wn[6]	Signed 16/16-bit fractional divide (W1:W0 preserved)	1	6	240
DIV2.U	Wm,Wn[6]	Unsigned 16/16-bit integer divide (W1:W0 preserved)	1	6	241
FLIM	Wb,Ws[6]	Force data (upper and lower) range limit without limit excess result	1	1	261
FLIM.V	Wb,Ws,Wnd[6]	Force data (upper and lower) range limit with limit excess result	1	1	262
INC	f {,WREG}[1]	Destination = f + 1	1	1[5]	267
INC	Ws,Wd	Wd = Ws + 1	1	1[5]	268
INC2	f {,WREG}[1]	Destination = f + 2	1	1[5]	269
INC2	Ws,Wd	Wd = Ws + 2	1	1[5]	270
MUL	f	W3:W2 = f * WREG	1	1[5]	323
MUL.SS	Wb,Ws,Wnd	{Wnd + 1,Wnd} = signed(Wb) * signed(Ws)	1	1[5]	325
MUL.SS	Wb,Ws,Acc[4]	Accumulator = signed(Wb) * signed(Ws)	1	1[5]	327
MUL.SU	Wb,#lit5,Wnd	{Wnd + 1, Wnd} = signed(Wb) * unsigned(lit5)	1	1	328

Note 1: When the optional {,WREG} operand is specified, the destination of the instruction is WREG. When {,WREG} is not specified, the destination of the instruction is the file register f.

2: In PIC24F, PIC24H, PIC24E, dsPIC30F, dsPIC33F and dsPIC33E devices, the divide instructions must be preceded with a "REPEAT #17" instruction, such that they are executed 18 consecutive times, thus taking 18 instruction cycles. In dsPIC33C devices, the divide instructions must be preceded with a "REPEAT #5" instruction, such that they are executed six consecutive times, thus taking six instruction cycles.

3: These instructions are only available in PIC24E, dsPIC33E and dsPIC33C devices.

4: These instructions are only available in dsPIC33E and dsPIC33C devices.

5: In PIC24E, dsPIC33E and dsPIC33C devices, read and Read-Modify-Write operations on non-CPU Special Function Registers require an additional cycle when compared to PIC24F, PIC24H, dsPIC30F and dsPIC33F devices.

6: These instructions are only available in dsPIC33C devices.

MULW.UU	Wb,Ws,Wnd(3)	Wnd = unsigned(Wb) * unsigned(Ws)	1	1(5)	348
MULW.UU	Wb,#lit5,Wnd(3)	Wnd = unsigned(Wb) * unsigned(lit5)	1	1	349
SE	Ws,Wnd	Wnd = sign-extended Ws	1	1(5)	406
SUB	f {,WREG}(1)	Destination = f – WREG	1	1(5)	418
SUB	#lit10,Wn	Wn = Wn – lit10	1	1	419
SUB	Wb,#lit5,Wd	Wd = Wb – lit5	1	1	420
SUB	Wb,Ws,Wd	Wd = Wb – Ws	1	1(5)	421
SUBB	f {,WREG}(1)	Destination = f – WREG – ($\overline{C}$)	1	1(5)	424
SUBB	#lit10,Wn	Wn = Wn – lit10 – ($\overline{C}$)	1	1	425
SUBB	Wb,#lit5,Wd	Wd = Wb – lit5 – ($\overline{C}$)	1	1	426
SUBB	Wb,Ws,Wd	Wd = Wb – Ws – ($\overline{C}$)	1	1(5)	428
SUBBR	f {,WREG}(1)	Destination = WREG – f – ($\overline{C}$)	1	1(5)	430
SUBBR	Wb,#lit5,Wd	Wd = lit5 – Wb – ($\overline{C}$)	1	1	431
SUBBR	Wb,Ws,Wd	Wd = Ws – Wb – ($\overline{C}$)	1	1(5)	433
SUBR	f {,WREG}(1)	Destination = WREG – f	1	1(5)	435
SUBR	Wb,#lit5,Wd	Wd = lit5 – Wb	1	1	436
SUBR	Wb,Ws,Wd	Wd = Ws – Wb	1	1(5)	437
ZE	Ws,Wnd	Wnd = zero-extended Ws	1	1(5)	456

Note 1: When the optional {,WREG} operand is specified, the destination of the instruction is WREG. When {,WREG} is not specified, the destination of the instruction is the file register f.

2: In PIC24F, PIC24H, PIC24E, dsPIC30F, dsPIC33F and dsPIC33E devices, the divide instructions must be preceded with a "REPEAT #17" instruction, such that they are executed 18 consecutive times, thus taking 18 instruction cycles. In dsPIC33C devices, the divide instructions must be preceded with a "REPEAT #5" instruction, such that they are executed six consecutive times, thus taking six instruction cycles.

3: These instructions are only available in PIC24E, dsPIC33E and dsPIC33C devices.

4: These instructions are only available in dsPIC33E and dsPIC33C devices.

5: In PIC24E, dsPIC33E and dsPIC33C devices, read and Read-Modify-Write operations on non-CPU Special Function Registers require an additional cycle when compared to PIC24F, PIC24H, dsPIC30F and dsPIC33F devices.

6: These instructions are only available in dsPIC33C devices.

Table 3-4: Logic Instructions

Assembly Syntax		Description	Words	Cycles	Page Number
AND	f {,WREG}(1)	Destination = f .AND. WREG	1	1(2)	116
AND	#lit10,Wn	Wn = lit10 .AND. Wn	1	1	117
AND	Wb,#lit5,Wd	Wd = Wb .AND. lit5	1	1	118
AND	Wb,Ws,Wd	Wd = Wb .AND. Ws	1	1(2)	119
CLR	f	f = 0x0000	1	1	192
CLR	WREG	WREG = 0x0000	1	1	192
CLR	Wd	Wd = 0x0000	1	1	193
COM	f {,WREG}(1)	Destination = $\overline{f}$	1	1(2)	197
COM	Ws,Wd	Wd = $\overline{Ws}$	1	1(2)	198
IOR	f {,WREG}(1)	Destination = f .IOR. WREG	1	1(2)	271
IOR	#lit10,Wn	Wn = lit10 .IOR. Wn	1	1	272
IOR	Wb,#lit5,Wd	Wd = Wb .IOR. lit5	1	1	273
IOR	Wb,Ws,Wd	Wd = Wb .IOR. Ws	1	1(2)	274
NEG	f {,WREG}(1)	Destination = $\overline{f}$ + 1	1	1(2)	350
NEG	Ws,Wd	Wd = $\overline{Ws}$ + 1	1	1(2)	351
SETM	f	f = 0xFFFF	1	1	408
SETM	WREG	WREG = 0xFFFF	1	1	409
SETM	Wd	Wd = 0xFFFF	1	1	409
XOR	f {,WREG}(1)	Destination = f .XOR. WREG	1	1(2)	451
XOR	#lit10,Wn	Wn = lit10 .XOR. Wn	1	1	452
XOR	Wb,#lit5,Wd	Wd = Wb .XOR. lit5	1	1	453
XOR	Wb,Ws,Wd	Wd = Wb .XOR. Ws	1	1(2)	454

Note 1: When the optional {,WREG} operand is specified, the destination of the instruction is WREG. When {,WREG} is not specified, the destination of the instruction is the file register f.

2: In PIC24E, dsPIC33E and dsPIC33C devices, read and Read-Modify-Write operations on non-CPU Special Function Registers require an additional cycle when compared to PIC24F, PIC24H, dsPIC30F and dsPIC33F devices.

Table 3-5: Rotate/Shift Instructions

Assembly Syntax		Description	Words	Cycles	Page Number
ASR	f {,WREG}[1]	Destination = arithmetic right shift f, LSb → C	1	1[2]	121
ASR	Ws,Wd	Wd = arithmetic right shift Ws, LSb → C	1	1[2]	123
ASR	Wb,#lit4,Wnd	Wnd = arithmetic right shift Wb by lit4	1	1	125
ASR	Wb,Wns,Wnd	Wnd = arithmetic right shift Wb by Wns	1	1	126
LSR	f {,WREG}[1]	Destination = logical right shift f, LSb → C	1	1[2]	282
LSR	Ws,Wd	Wd = logical right shift Ws, LSb → C	1	1[2]	284
LSR	Wb,#lit4,Wnd	Wnd = logical right shift Wb by lit4	1	1	286
LSR	Wb,Wns,Wnd	Wnd = logical right shift Wb by Wns	1	1	287
RLC	f {,WREG}[1]	Destination = rotate left through Carry f	1	1[2]	388
RLC	Ws,Wd	Wd = rotate left through Carry Ws	1	1[2]	389
RLNC	f {,WREG}[1]	Destination = rotate left (no Carry) f	1	1[2]	391
RLNC	Ws,Wd	Wd = rotate left (no Carry) Ws	1	1[2]	392
RRC	f {,WREG}[1]	Destination = rotate right through Carry f	1	1[2]	394
RRC	Ws,Wd	Wd = rotate right through Carry Ws	1	1[2]	396
RRNC	f {,WREG}[1]	Destination = rotate right (no Carry) f	1	1[2]	398
RRNC	Ws,Wd	Wd = rotate right (no Carry) Ws	1	1[2]	399
SL	f {,WREG}[1]	Destination = left shift f, MSb → C	1	1[2]	412
SL	Ws,Wd	Wd = left shift Ws, MSb → C	1	1[2]	414
SL	Wb,#lit4,Wnd	Wnd = left shift Wb by lit4	1	1	416
SL	Wb,Wns,Wnd	Wnd = left shift Wb by Wns	1	1	417

Note 1: When the optional {,WREG} operand is specified, the destination of the instruction is WREG. When {,WREG} is not specified, the destination of the instruction is the file register f.

2: In PIC24E, dsPIC33E and dsPIC33C devices, read and Read-Modify-Write operations on non-CPU Special Function Registers require an additional cycle when compared to PIC24F, PIC24H, dsPIC30F and dsPIC33F devices.

Table 3-6: Bit Instructions

Assembly Syntax		Description	Words	Cycles[1]	Page Number
BCLR	f,#bit4	Bit clear in f	1	1	127
BCLR	Ws,#bit4	Bit clear in Ws	1	1	128
BFEXT	#bit4,#wid5,Ws,Wb[2]	Bit field extract from Ws to Wb	2	2	130
BFEXT	#bit4,#wid5,f,Wb[2]	Bit field extract from f to Wb	2	2	131
BFINS	#bit4,#wid5,Wb,Ws[2]	Bit field insert from Wb into Ws	2	2	132
BFINS	#bit4,#wid5,Wb,f[2]	Bit field insert from Wb into f	2	2	133
BFINS	#bit4,#wid5,#lit8,Ws[2]	Bit field insert from #lit8 into Ws	2	2	134
BSET	f,#bit4	Bit set in f	1	1	160
BSET	Ws,#bit4	Bit set in Ws	1	1	161
BSW	Ws,Wb	Write C bit to Ws<Wb>	1	1	163
BTG	f,#bit4	Bit toggle in f	1	1	165
BTG	Ws,#bit4	Bit toggle in Ws	1	1	166
BTST	f,#bit4	Bit test in f	1	1	175
BTST	Ws,#bit4	Bit test in Ws	1	1	176
BTST	Ws,Wb	Bit test in Ws	1	1	178
BTSTS	f,#bit4	Bit test f to Z, then set f	1	1	180
BTSTS	Ws,#bit4	Bit test Ws to C, then set Ws	1	1	181
FBCL	Ws,Wnd	Find bit change from left (MSb) side	1	1	255
FF1L	Ws,Wnd	Find first one from left (MSb) side	1	1	257
FF1R	Ws,Wnd	Find first one from right (LSb) side	1	1	259

Note 1: In dsPIC33E, dsPIC33C and PIC24E devices, read and Read-Modify-Write operations on non-CPU Special Function Registers require an additional cycle when compared to dsPIC30F, dsPIC33F, PIC24F and PIC24H devices.

2: These instructions are only available in dsPIC33C devices.

Table 3-7: Compare/Skip and Compare/Branch Instructions

Assembly Syntax		Description	Words	Cycles[1]	Page Number
BTSC	f,#bit4	Bit test f, skip if clear	1	1 (2 or 3)[5]	168
BTSC	Ws,#bit4	Bit test Ws, skip if clear	1	1 (2 or 3)[5]	170
BTSS	f,#bit4	Bit test f, skip if set	1	1 (2 or 3)[5]	172
BTSS	Ws,#bit4	Bit test Ws, skip if set	1	1 (2 or 3)[5]	173
CP	f	Compare (f – WREG)	1	1[5]	200
CP	Wb,#lit5[2]	Compare (Wb – lit5)	1	1	201
CP	Wb,#lit8[3]	Compare (Wb – lit8)	1	1	202
CP	Wb,Ws	Compare (Wb – Ws)	1	1[5]	203
CP0	f	Compare (f – 0x0000)	1	1[5]	204
CP0	Ws	Compare (Ws – 0x0000)	1	1[5]	205
CPB	f	Compare with Borrow (f – WREG – $\overline{C}$)	1	1[5]	206
CPB	Wb,#lit5[2]	Compare with Borrow (Wb – lit5 – $\overline{C}$)	1	1	207
CPB	Wb,#lit8[3]	Compare with Borrow (Wb – lit8 – $\overline{C}$)	1	1	208
CPB	Wb,Ws	Compare with Borrow (Wb – Ws – $\overline{C}$)	1	1[5]	209
CPBEQ	Wb,Wn,Expr[3]	Compare Wb with Wn, branch if =	1	1 (5)[4]	211
CPBGT	Wb,Wn,Expr[3]	Signed compare Wb with Wn, branch if >	1	1 (5)[4]	212
CPBLT	Wb,Wn,Expr[3]	Signed compare Wb with Wn, branch if <	1	1 (5)[4]	213
CPBNE	Wb,Wn,Expr[3]	Compare Wb with Wn, branch if ≠	1	1 (5)[4]	212
CPSEQ	Wb,Wn[2]	Compare (Wb – Wn), skip if =	1	1 (2 or 3)	215
CPSEQ	Wb,Wn[3]	Compare (Wb – Wn), skip if =	1	1 (2 or 3)	216
CPSGT	Wb,Wn[2]	Signed compare (Wb – Wn), skip if >	1	1 (2 or 3)	217
CPSGT	Wb,Wn[3]	Signed compare (Wb – Wn), skip if >	1	1 (2 or 3)	218
CPSLT	Wb,Wn[2]	Signed compare (Wb – Wn), skip if <	1	1 (2 or 3)	219
CPSLT	Wb,Wn[3]	Signed compare (Wb – Wn), skip if <	1	1 (2 or 3)	220
CPSNE	Wb,Wn[2]	Signed compare (Wb – Wn), skip if ≠	1	1 (2 or 3)	221
CPSNE	Wb,Wn[3]	Signed compare (Wb – Wn), skip if ≠	1	1 (2 or 3)	222

Note 1: Conditional skip instructions execute in one cycle if the skip is not taken, two cycles if the skip is taken over a one-word instruction and three cycles if the skip is taken over a two-word instruction.

2: This instruction is only available in PIC24F, PIC24H, dsPIC30F and dsPIC33F devices.

3: This instruction is only available in PIC24E, dsPIC33E and dsPIC33C devices.

4: Compare/Branch instructions in PIC24E/dsPIC33E devices and in dsPIC33C Master cores execute in one cycle if the branch is not taken, and five cycles if the branch is taken. Compare/Branch instructions in dsPIC33C Slave cores execute in one cycle if the branch is not taken and two cycles if the branch is taken.

5: In PIC24E, dsPIC33E and dsPIC33C devices, read and Read-Modify-Write operations on non-CPU Special Function Registers require an additional cycle when compared to PIC24F, PIC24H, dsPIC30F and dsPIC33F devices.

Table 3-8: Program Flow Instructions

Assembly Syntax		Description	Words	Cycles	Page Number
BRA	Expr	Branch unconditionally	1	2(8)	136
BRA	Wn(5)	Computed branch	1	2(8)	137
BRA	Wn(4)	Computed branch	1	2(8)	138
BRA C	Expr	Branch if Carry (no Borrow)	1	1 (2)(1,8)	139
BRA GE	Expr	Branch if signed greater than or equal	1	1 (2)(1,8)	141
BRA GEU	Expr	Branch if unsigned greater than or equal	1	1 (2)(1,8)	142
BRA GT	Expr	Branch if signed greater than	1	1 (2)(1,8)	143
BRA GTU	Expr	Branch if unsigned greater than	1	1 (2)(1,8)	144
BRA LE	Expr	Branch if signed less than or equal	1	1 (2)(1,8)	145
BRA LEU	Expr	Branch if unsigned less than or equal	1	1 (2)(1,8)	146
BRA LT	Expr	Branch if signed less than	1	1 (2)(1,8)	147
BRA LTU	Expr	Branch if unsigned less than	1	1 (2)(1,8)	148
BRA N	Expr	Branch if Negative	1	1 (2)(1,8)	149
BRA NC	Expr	Branch if not Carry (Borrow)	1	1 (2)(1,8)	150
BRA NN	Expr	Branch if not Negative	1	1 (2)(1,8)	151
BRA NOV	Expr	Branch if not Overflow	1	1 (2)(1,8)	152
BRA NZ	Expr	Branch if not Zero	1	1 (2)(1,8)	153
BRA OA	Expr(3)	Branch if Accumulator A Overflow	1	1 (2)(1,8)	154
BRA OB	Expr(3)	Branch if Accumulator B Overflow	1	1 (2)(1,8)	155
BRA OV	Expr	Branch if Overflow	1	1 (2)(1,8)	156
BRA SA	Expr(3)	Branch if Accumulator A Saturate	1	1 (2)(1,8)	157
BRA SB	Expr(3)	Branch if Accumulator B Saturate	1	1 (2)(1,8)	158
BRA Z	Expr	Branch if Zero	1	1 (2)(1,8)	159
CALL	Expr(5)	Call subroutine	2	2(8)	183
CALL	Expr(4)	Call subroutine	2	2(8)	185
CALL	Wn(5)	Call indirect subroutine	1	2(8)	187
CALL	Wn(4)	Call indirect subroutine	1	2(8)	189
CALL.L	Wn(4)	Call indirect subroutine long (long address)	1	4	191
DO	#lit14,Expr(6)	Do code through PC + Expr, (lit14 + 1) times	2	2	242
DO	#lit15,Expr(7)	Do code through PC + Expr, (lit15 + 1) times	2	2	244
DO	Wn,Expr(6)	Do code through PC + Expr, (Wn + 1) times	2	2	246
DO	Wn,Expr(7)	Do code through PC + Expr, (Wn + 1) times	2	2	248

Note 1: Conditional branch instructions execute in one cycle if the branch is not taken or two cycles if the branch is taken.

2: RETURN instructions execute in three cycles, but if an exception is pending, they execute in two cycles.

3: This instruction is only available in dsPIC30F, dsPIC33F, dsPIC33E and dsPIC33C devices.

4: This instruction is only available in PIC24E, dsPIC33E and dsPIC33C devices.

5: This instruction is only available in PIC24F, PIC24H, dsPIC30F and dsPIC33F devices.

6: This instruction is only available in dsPIC30F and dsPIC33F devices.

7: This instruction is only available in dsPIC33E and dsPIC33C devices.

8: In PIC24E and dsPIC33E devices, and in dsPIC33C Master cores, these instructions require two additional cycles (four cycles overall) when the branch is taken when compared to PIC24F, PIC24H, dsPIC30F and dsPIC33F devices, and dsPIC33C Slave cores.

9: In dsPIC33E and PIC24E devices, and in dsPIC33C Master cores, these instructions require three additional cycles when compared to dsPIC30F, dsPIC33F, PIC24F and PIC24H devices, and dsPIC33C Slave cores.

Table 3-8: Program Flow Instructions (Continued)

Assembly Syntax		Description	Words	Cycles	Page Number
GOTO	Expr	Go to address	2	2(8)	263
GOTO	Wn(5)	Go to address indirectly	1	2(8)	264
GOTO	Wn(4)	Go to address indirectly	1	2(8)	265
GOTO.L	Wn(4)	Go to indirect (long address)	1	4	266
RCALL	Expr(5)	Relative call	1	2(8)	367
RCALL	Expr(4)	Relative call	1	2(8)	369
RCALL	Wn(5)	Computed call	1	2(8)	371
RCALL	Wn(4)	Computed call	1	2(8)	373
REPEAT	#lit14(5)	Repeat next instruction (lit14 + 1) times	1	1	375
REPEAT	#lit15(4)	Repeat next instruction (lit15 + 1) times	1	1	376
REPEAT	Wn(5)	Repeat next instruction (Wn + 1) times	1	1	377
REPEAT	Wn(4)	Repeat next instruction (Wn + 1) times	1	1	378
RETFIE(5)		Return from interrupt enable	1	3 (2)(2,9)	380
RETFIE(4)		Return from interrupt enable	1	3 (2)(2,9)	381
RETLW	#lit10,Wn(5)	Return with lit10 in Wn	1	3 (2)(2,9)	382
RETLW	#lit10,Wn(4)	Return with lit10 in Wn	1	3 (2)(2,9)	384
RETURN(5)		Return from subroutine	1	3 (2)(2,9)	386
RETURN(4)		Return from subroutine	1	3 (2)(2,9)	387

Note 1: Conditional branch instructions execute in one cycle if the branch is not taken or two cycles if the branch is taken.

2: RETURN instructions execute in three cycles, but if an exception is pending, they execute in two cycles.

3: This instruction is only available in dsPIC30F, dsPIC33F, dsPIC33E and dsPIC33C devices.

4: This instruction is only available in PIC24E, dsPIC33E and dsPIC33C devices.

5: This instruction is only available in PIC24F, PIC24H, dsPIC30F and dsPIC33F devices.

6: This instruction is only available in dsPIC30F and dsPIC33F devices.

7: This instruction is only available in dsPIC33E and dsPIC33C devices.

8: In PIC24E and dsPIC33E devices, and in dsPIC33C Master cores, these instructions require two additional cycles (four cycles overall) when the branch is taken when compared to PIC24F, PIC24H, dsPIC30F and dsPIC33F devices, and dsPIC33C Slave cores.

9: In dsPIC33E and PIC24E devices, and in dsPIC33C Master cores, these instructions require three additional cycles when compared to dsPIC30F, dsPIC33F, PIC24F and PIC24H devices, and dsPIC33C Slave cores.

Table 3-9: Shadow/Stack/Context Instructions

Assembly Syntax		Description	Words	Cycles	Page Number
BOOTSWP[4]		Swap the active and inactive program Flash spaces	1	2	135
CTXTSWP	#lit3[2,3]	Switch CPU register context to context defined by #lit3	1	2	223
CTXTSWP	Wn[2,3]	Switch CPU register context to context defined by Wn	1	2	224
LNK	#lit14[5]	Link Frame Pointer	1	1	280
LNK	#lit14[6]	Link Frame Pointer	1	1	281
POP	f	Pop TOS to f	1	1	357
POP	Wd	Pop TOS to Wd	1	1	358
POP.D	Wnd	Double pop from TOS to Wnd:Wnd + 1	1	2	359
POP.S		POP shadow registers	1	1	360
PUSH	f	Push f to TOS	1	1[1]	361
PUSH	Ws	Push Ws to TOS	1	1[1]	362
PUSH.D	Wns	Push double Wns:Wns + 1 to TOS	1	2	364
PUSH.S		Push shadow registers	1	1	365
ULNK[5]		Unlink Frame Pointer	1	1	448
ULNK[6]		Unlink Frame Pointer	1	1	449

Note 1: In PIC24E, dsPIC33E and dsPIC33C devices, read and Read-Modify-Write operations on non-CPU Special Function Registers require an additional cycle when compared to PIC24F, PIC24H, dsPIC30F and dsPIC33F devices.

2: These instructions are only available in dsPIC33C and some dsPIC33E devices. Please see the specific device data sheet for details.

3: In dsPIC33C devices, these instructions also switch the accumulator context in addition to the CPU register context.

4: These instructions are only available in some PIC24F, dsPIC33E and dsPIC33C devices. Please see the specific device data sheet for details.

5: These instructions are only available in PIC24F, PIC24H, dsPIC30F and dsPIC33F devices. Please see the specific device data sheet for details.

6: These instructions are only available in PIC24E, dsPIC33E and dsPIC33C devices. Please see the specific device data sheet for details.

Table 3-10: Control Instructions

Assembly Syntax		Description	Words	Cycles	Page Number
CLRWDT		Clear Watchdog Timer	1	1	196
DISI	#lit14	Disable interrupts for (lit14 + 1) instruction cycles	1	1	232
NOP		No operation	1	1	354
NOPR		No operation	1	1	355
PWRSAV	#lit1	Enter Power-Saving mode lit1	1	1	366
RESET		Software Device Reset	1	1	379

© 2005-2018 Microchip Technology Inc.

Table 3-11: DSP Instructions (dsPIC30F, dsPIC33F, dsPIC33E and dsPIC33C Devices)

Assembly Syntax		Description	Words	Cycles	Page Number
ADD	Acc	Add accumulators	1	1	107
ADD	Ws,#Slit4,Acc	16-bit signed add to accumulator	1	1(1)	108
CLR	Acc,[Wx],Wxd,[Wy],Wyd,AWB	Clear accumulator, prefetch operands	1	1	194
ED	Wm*Wm,Acc,[Wx],[Wy],Wxd	Euclidean distance (no accumulate)	1	1	250
EDAC	Wm*Wm,Acc,[Wx],[Wy],Wxd	Euclidean distance	1	1	252
LAC	Ws,#Slit4,Acc	Load accumulator	1	1(1)	276
LAC.D	Wso,#Slit4,Acc(2)	Load accumulator double word	1	1	278
MAC	Wm*Wn,Acc,[Wx],Wxd,[Wy],Wyd,AWB	Multiply and accumulate	1	1	288
MAC	Wm*Wm,Acc,[Wx],Wxd,[Wy],Wyd	Square and accumulate	1	1	290
MAX	Acc(2)	Force accumulator maximum data limit	1	1	292
MAX.V	Acc,Wd(2)	Force accumulator maximum data limit and store limit excess result	1	1	293
MIN	Acc(2)	Force accumulator minimum data limit	1	1	294
MIN.V	Acc,Wd(2)	Force accumulator minimum data limit and store limit excess result	1	1	295
MINZ	Acc(2)	Conditionally force accumulator minimum data limit if Z flag is set	1	1	296
MINZ.V	Acc,Wd(2)	Conditionally force accumulator minimum data limit and store limit excess result if Z flag is set	1	1	297
MOVSAC	Acc,[Wx],Wxd,[Wy],Wyd,AWB	Move Wx to Wxd and Wy to Wyd	1	1	313
MPY	Wm*Wn,Acc,[Wx],Wxd,[Wy],Wyd	Multiply Wm by Wn to accumulator	1	1	315
MPY	Wm*Wm,Acc,[Wx],Wxd,[Wy],Wyd	Square to accumulator	1	1	317
MPY.N	Wm*Wn,Acc,[Wx],Wxd,[Wy],Wyd	(Multiply -Wm by Wn) to accumulator	1	1	319
MSC	Wm*Wn,Acc,[Wx],Wxd,[Wy],Wyd,AWB	Multiply and subtract from accumulator	1	1	321
NEG	Acc	Negate accumulator	1	1	350
NORM	Acc,Wd(2)	Normalize accumulator	1	1	356
SAC	Acc,#Slit4,Wd	Store accumulator	1	1	401
SAC.D	Acc,#Slit4,Wnd(2)	Store accumulator double word	1	1	403
SAC.R	Acc,#Slit4,Wd	Store rounded accumulator	1	1	404
SFTAC	Acc,#Slit6	Arithmetic shift accumulator by Slit6	1	1	410
SFTAC	Acc,Wb	Arithmetic shift accumulator by (Wb)	1	1	411
SUB	Acc	Subtract accumulators	1	1	418

Note 1: In PIC24E, dsPIC33E and dsPIC33C devices, read and Read-Modify-Write operations on non-CPU Special Function Registers require an additional cycle when compared to PIC24F, PIC24H, dsPIC30F and dsPIC33F devices.

2: These instructions are only available in dsPIC33C devices.

Section 4. Instruction Set Details

HIGHLIGHTS

This section of the manual contains the following major topics:

4.1 Data Addressing Modes 54
4.2 Program Addressing Modes 63
4.3 Instruction Stalls 64
4.4 Byte Operations 66
4.5 Word Move Operations 68
4.6 Using 10-Bit Literal Operands 71
4.8 Software Stack Pointer and Frame Pointer 72
4.9 Conditional Branch Instructions 78
4.10 Z Status Bit 79
4.11 Assigned Working Register Usage 80
4.12 DSP Data Formats (dsPIC30F, dsPIC33F, dsPIC33E and dsPIC33C Devices) 83
4.13 Accumulator Usage (dsPIC30F, dsPIC33F, dsPIC33E and dsPIC33C Devices) 85
4.14 Accumulator Access (dsPIC30F, dsPIC33F, dsPIC33E and dsPIC33C Devices) 86
4.15 DSP MAC Instructions (dsPIC30F, dsPIC33F, dsPIC33E and dsPIC33C Devices) 86
4.16 DSP Accumulator Instructions (dsPIC30F, dsPIC33F, dsPIC33E and dsPIC33C Devices) 90
4.17 Scaling Data with the FBCL Instruction (dsPIC30F, dsPIC33F, dsPIC33E and dsPIC33C Devices) 90
4.19 Normalizing the Accumulator with the FBCL Instruction (dsPIC30F, dsPIC33F, dsPIC33E and dsPIC33C Devices) 93
4.21 Extended Precision Arithmetic Using Mixed-Sign Multiplications (dsPIC33E and dsPIC33C Only) 94

4.1 DATA ADDRESSING MODES

The 16-bit MCU and DSC devices support three native addressing modes for accessing data memory, along with several forms of Immediate Addressing. Data accesses may be performed using File Register Addressing, Register Direct or Indirect Addressing, and Immediate Addressing, allowing a fixed value to be used by the instruction.

File Register Addressing provides the ability to operate on data stored in the lower 8K of data memory (Near RAM), and also move data between the Working registers and the entire 64K data space. Register Direct Addressing is used to access the 16 memory-mapped Working registers, W0:W15. Register Indirect Addressing is used to efficiently operate on data stored in the entire 64K data space (and also Extended Data Space in the case of dsPIC33E/dsPIC33C/PIC24E and some PIC24F devices), using the contents of the Working registers as an Effective Address (EA). Immediate Addressing does not access data memory, but provides the ability to use a constant value as an instruction operand. The address range of each mode is summarized in Table 4-1.

Table 4-1: 16-Bit MCU and DSC Addressing Modes

Addressing Mode	Address Range
File Register	0x0000-0x1FFF(1)
Register Direct	0x0000-0x001F (Working register array, W0:W15)
Register Indirect	0x0000-0xFFFF
Immediate	N/A (constant value)

Note 1: The address range for the File Register `MOV` is 0x0000-0xFFFE.

4.1.1 File Register Addressing

File Register Addressing is used by instructions which use a predetermined data address as an operand for the instruction. The majority of instructions that support File Register Addressing provide access to the lower 8 Kbytes of data memory, which is called the Near RAM. However, the `MOV` instruction provides access to all 64 Kbytes of memory using File Register Addressing. This allows the loading of the data from any location in data memory to any Working register and storing the contents of any Working register to any location in data memory. It should be noted that File Register Addressing supports both byte and word accesses of data memory, with the exception of the `MOV` instruction, which accesses all 64K of memory as words. Examples of File Register Addressing are shown in Example 4-1.

Most instructions which support File Register Addressing perform an operation on the specified file register and the default Working register, WREG (see **Section 2.4 "Default Working Register (WREG)"**). If only one operand is supplied in the instruction, WREG is an implied operand and the operation results are stored back to the file register. In these cases, the instruction is effectively a Read-Modify-Write instruction. However, when both the file register and the WREG register are specified in the instruction, the operation results are stored in the WREG register and the contents of the file register are unchanged. Sample instructions that show the interaction between the file register and the WREG register are shown in Example 4-2.

Note:	Instructions which support File Register Addressing use 'f' as an operand in the instruction summary tables of **Section 3. "Instruction Set Overview"**.

© 2005-2018 Microchip Technology Inc.

Example 4-1: File Register Addressing

```
    DEC     0x1000          ; decrement data stored at 0x1000
```

Before Instruction:

```
    Data Memory 0x1000 = 0x5555
```

After Instruction:

```
    Data Memory 0x1000 = 0x5554

    MOV     0x27FE, W0      ; move data stored at 0x27FE to W0
```

Before Instruction:

```
    W0 = 0x5555
    Data Memory 0x27FE = 0x1234
```

After Instruction:

```
    W0 = 0x1234
    Data Memory 0x27FE = 0x1234
```

Example 4-2: File Register Addressing and WREG

```
    AND     0x1000          ; AND 0x1000 with WREG, store to 0x1000
```

Before Instruction:

```
    W0 (WREG) = 0x332C
    Data Memory 0x1000 = 0x5555
```

After Instruction:

```
    W0 (WREG) = 0x332C
    Data Memory 0x1000 = 0x1104

    AND     0x1000, WREG    ; AND 0x1000 with WREG, store to WREG
```

Before Instruction:

```
    W0 (WREG) = 0x332C
    Data Memory 0x1000 = 0x5555
```

After Instruction:

```
    W0 (WREG) = 0x1104
    Data Memory 0x1000 = 0x5555
```

4.1.2 Register Direct Addressing

Register Direct Addressing is used to access the contents of the 16 Working registers (W0:W15). The Register Direct Addressing mode is fully orthogonal, which allows any Working register to be specified for any instruction that uses Register Direct Addressing, and it supports both byte and word accesses. Instructions which employ Register Direct Addressing use the contents of the specified Working register as data to execute the instruction; therefore, this addressing mode is useful only when data already resides in the Working register core. Sample instructions which utilize Register Direct Addressing are shown in Example 4-3.

Another feature of Register Direct Addressing is that it provides the ability for dynamic flow control. Since variants of the DO and REPEAT instruction support Register Direct Addressing, flexible looping constructs may be generated using these instructions.

Note: Instructions which must use Register Direct Addressing, use the symbols Wb, Wn, Wns and Wnd in the summary tables of **Section 3. "Instruction Set Overview"**. Commonly, Register Direct Addressing may also be used when Register Indirect Addressing may be used. Instructions which use Register Indirect Addressing, use the symbols Wd and Ws in the summary tables of **Section 3. "Instruction Set Overview"**.

Example 4-3: Register Direct Addressing

```
    EXCH    W2, W3          ; Exchange W2 and W3
```

Before Instruction:

```
    W2 = 0x3499
    W3 = 0x003D
```

After Instruction:

```
    W2 = 0x003D
    W3 = 0x3499

    IOR     #0x44, W0       ; Inclusive-OR 0x44 and W0
```

Before Instruction:

```
    W0 = 0x9C2E
```

After Instruction:

```
    W0 = 0x9C6E

    SL      W6, W7, W8      ; Shift left W6 by W7, and store to W8
```

Before Instruction:

```
    W6 = 0x000C
    W7 = 0x0008
    W8 = 0x1234
```

After Instruction:

```
    W6 = 0x000C
    W7 = 0x0008
    W8 = 0x0C00
```

4.1.3 Register Indirect Addressing

Register Indirect Addressing is used to access any location in data memory by treating the contents of a Working register as an Effective Address (EA) to data memory. Essentially, the contents of the Working register become a pointer to the location in data memory which is to be accessed by the instruction.

This addressing mode is powerful, because it also allows one to modify the contents of the Working register, either before or after the data access is made, by incrementing or decrementing the EA. By modifying the EA in the same cycle that an operation is being performed, Register Indirect Addressing allows for the efficient processing of data that is stored sequentially in memory. The modes of Indirect Addressing supported by the 16-bit MCU and DSC devices are shown in Table 4-2.

Table 4-2: Indirect Addressing Modes

Indirect Mode	Syntax	Function (Byte Instruction)	Function (Word Instruction)	Description
No Modification	[Wn]	EA = [Wn]	EA = [Wn]	The contents of Wn form the EA.
Pre-Increment	[++Wn]	EA = [Wn + = 1]	EA = [Wn + = 2]	Wn is pre-incremented to form the EA.
Pre-Decrement	[--Wn]	EA = [Wn – = 1]	EA = [Wn – = 2]	Wn is pre-decremented to form the EA.
Post-Increment	[Wn++]	EA = [Wn]+ = 1	EA = [Wn]+ = 2	The contents of Wn form the EA, then Wn is post-incremented.
Post-Decrement	[Wn--]	EA = [Wn] – = 1	EA = [Wn] – = 2	The contents of Wn form the EA, then Wn is post-decremented.
Register Offset	[Wn+Wb]	EA = [Wn + Wb]	EA = [Wn + Wb]	The sum of Wn and Wb forms the EA. Wn and Wb are not modified.

© 2005-2018 Microchip Technology Inc.

Table 4-2 shows that four addressing modes modify the EA used in the instruction, and this allows the following updates to be made to the Working register: post-increment, post-decrement, pre-increment and pre-decrement. Since all EAs must be given as byte addresses, support is provided for Word mode instructions by scaling the EA update by two. Namely, in Word mode, pre/post-decrements subtract two from the EA stored in the Working register and pre/post-increments add two to the EA. This feature ensures that after an EA modification is made, the EA will point to the next adjacent word in memory. Example 4-4 shows how Indirect Addressing may be used to update the EA.

Table 4-2 also shows that the Register Offset mode addresses data which is offset from a base EA stored in a Working register. This mode uses the contents of a second Working register to form the EA by adding the two specified Working registers. This mode does not scale for Word mode instructions, but offers the complete offset range of 64 Kbytes. Note that neither of the Working registers used to form the EA is modified. Example 4-5 shows how Register Offset Indirect Addressing may be used to access data memory.

Note: The MOV with offset instructions (see pages 299 and 300) provides a literal addressing offset ability to be used with Indirect Addressing. In these instructions, the EA is formed by adding the contents of a Working register to a signed 10-bit literal. Example 4-6 shows how these instructions may be used to move data to and from the Working register array.

Example 4-4: Indirect Addressing with Effective Address Update

```
    MOV.B   [W0++], [W13--]        ; byte move [W0] to [W13]
                                   ; post-inc W0, post-dec W13
```

Before Instruction:

```
    W0 = 0x2300
    W13 = 0x2708
    Data Memory 0x2300 = 0x7783
    Data Memory 0x2708 = 0x904E
```

After Instruction:

```
    W0 = 0x2301
    W13 = 0x2707
    Data Memory 0x2300 = 0x7783
    Data Memory 0x2708 = 0x9083

    ADD     W1, [--W5], [++W8]     ; pre-dec W5, pre-inc W8
                                   ; add W1 to [W5], store in [W8]
```

Before Instruction:

```
    W1 = 0x0800
    W5 = 0x2200
    W8 = 0x2400
    Data Memory 0x21FE = 0x7783
    Data Memory 0x2402 = 0xAACC
```

After Instruction:

```
    W1 = 0x0800
    W5 = 0x21FE
    W8 = 0x2402
    Data Memory 0x21FE = 0x7783
    Data Memory 0x2402 = 0x7F83
```

Example 4-5: Indirect Addressing with Register Offset

```
    MOV.B   [W0+W1], [W7++]        ; byte move [W0+W1] to W7, post-inc W7
```

Before Instruction:

```
    W0 = 0x2300
    W1 = 0x01FE
    W7 = 0x1000
    Data Memory 0x24FE = 0x7783
    Data Memory 0x1000 = 0x11DC
```

After Instruction:

```
    W0 = 0x2300
    W1 = 0x01FE
    W7 = 0x1001
    Data Memory 0x24FE = 0x7783
    Data Memory 0x1000 = 0x1183

    LAC     [W0+W8], A             ; load ACCA with [W0+W8]
                                   ; (sign-extend and zero-backfill)
```

Before Instruction:

```
    W0 = 0x2344
    W8 = 0x0008
    ACCA = 0x00 7877 9321
    Data Memory 0x234C = 0xE290
```

After Instruction:

```
    W0 = 0x2344
    W8 = 0x0008
    ACCA = 0xFF E290 0000
    Data Memory 0x234C = 0xE290
```

Example 4-6: Move with Literal Offset Instructions

```
    MOV     [W0+0x20], W1          ; move [W0+0x20] to W1
```

Before Instruction:

```
    W0 = 0x1200
    W1 = 0x01FE
    Data Memory 0x1220 = 0xFD27
```

After Instruction:

```
    W0 = 0x1200
    W1 = 0xFD27
    Data Memory 0x1220 = 0xFD27

    MOV     W4, [W8-0x300]         ; move W4 to [W8-0x300]
```

Before Instruction:

```
    W4 = 0x3411
    W8 = 0x2944
    Data Memory 0x2644 = 0xCB98
```

After Instruction:

```
    W4 = 0x3411
    W8 = 0x2944
    Data Memory 0x2644 = 0x3411
```

4.1.3.1 REGISTER INDIRECT ADDRESSING AND THE INSTRUCTION SET

The addressing modes presented in Table 4-2 demonstrate the Indirect Addressing mode capability of the 16-bit MCU and DSC devices. Due to operation encoding and functional considerations, not every instruction which supports Indirect Addressing supports all modes shown in Table 4-2. The majority of instructions which use Indirect Addressing support the No Modify, Pre-Increment, Pre-Decrement, Post-Increment and Post-Decrement Addressing modes. The MOV instructions, and several accumulator-based DSP instructions (dsPIC30F, dsPIC33F, dsPIC33E and dsPIC33C devices only), are also capable of using the Register Offset Addressing mode.

Note: Instructions which use Register Indirect Addressing use the operand symbols, Wd and Ws, in the summary tables of **Section 3. "Instruction Set Overview"**.

4.1.3.2 DSP MAC INDIRECT ADDRESSING MODES (dsPIC30F, dsPIC33F, dsPIC33E AND dsPIC33C DEVICES)

A special class of Indirect Addressing modes is utilized by the DSP MAC instructions. As is described later in **Section 4.15 "DSP MAC Instructions (dsPIC30F, dsPIC33F, dsPIC33E and dsPIC33C Devices)"**, the DSP MAC class of instructions is capable of performing two fetches from memory using Effective Addressing. Since DSP algorithms frequently demand a broader range of address updates, the addressing modes offered by the DSP MAC instructions provide greater range in the size of the Effective Address update which may be made. Table 4-3 shows that both X and Y prefetches support Post-Increment and Post-Decrement Addressing modes, with updates of two, four and six bytes. Since DSP instructions only execute in Word mode, no provisions are made for odd-sized EA updates.

Table 4-3: DSP MAC Indirect Addressing Modes

Addressing Mode	X Memory	Y Memory
Indirect with No Modification	EA = [Wx]	EA = [Wy]
Indirect with Post-Increment by two	EA = [Wx] + = 2	EA = [Wy] + = 2
Indirect with Post-Increment by four	EA = [Wx] + = 4	EA = [Wy] + = 4
Indirect with Post-Increment by six	EA = [Wx] + = 6	EA = [Wy] + = 6
Indirect with Post-Decrement by two	EA = [Wx] – = 2	EA = [Wy] – = 2
Indirect with Post-Decrement by four	EA = [Wx] – = 4	EA = [Wy] – = 4
Indirect with Post-Decrement by six	EA = [Wx] – = 6	EA = [Wy] – = 6
Indirect with Register Offset	EA = [W9 + W12]	EA = [W11 + W12]

Note: As described in **Section 4.15 "DSP MAC Instructions (dsPIC30F, dsPIC33F, dsPIC33E and dsPIC33C Devices)"**, only W8 and W9 may be used to access X memory, and only W10 and W11 may be used to access Y memory.

4.1.3.3 MODULO AND BIT-REVERSED ADDRESSING MODES (dsPIC30F, dsPIC33F, dsPIC33E AND dsPIC33C DEVICES)

The 16-bit DSC architecture provides support for two special Register Indirect Addressing modes, which are commonly used to implement DSP algorithms. Modulo (or circular) Addressing provides an automated means to support circular data buffers in X and/or Y memory. Modulo buffers remove the need for software to perform address boundary checks, which can improve the performance of certain algorithms. Similarly, Bit-Reversed Addressing allows one to access the elements of a buffer in a nonlinear fashion. This addressing mode simplifies data re-ordering for radix-2 FFT algorithms and provides a significant reduction in FFT processing time.

Both of these addressing modes are powerful features of the dsPIC30F, dsPIC33F, dsPIC33E and dsPIC33C architectures, which can be exploited by any instruction that uses Indirect Addressing. Refer to the specific device family reference manual for details on using Modulo and Bit-Reversed Addressing.

4.1.4 Immediate Addressing

In Immediate Addressing, the instruction encoding contains a predefined constant operand, which is used by the instruction. This addressing mode may be used independently, but it is more frequently combined with the File Register, Direct and Indirect Addressing modes. The size of the immediate operand which may be used varies with the instruction type. Constants of size 1-bit (#lit1), 4-bit (#bit4, #lit4 and #Slit4), 5-bit (#lit5), 6-bit (#Slit6), 8-bit (#lit8), 10-bit (#lit10 and #Slit10), 14-bit (#lit14) and 16-bit (#lit16) may be used. Constants may be signed or unsigned and the symbols, #Slit4, #Slit6 and #Slit10, designate a signed constant. All other immediate constants are unsigned. Table 4-4 shows the usage of each immediate operand in the instruction set.

Note: The 6-bit (#Slit6) operand is only available in dsPIC30F, dsPIC33F, dsPIC33E and dsPIC33C devices.

Table 4-4: Immediate Operands in the Instruction Set

Operand	Instruction Usage
#lit1	PWRSAV
#lit3	CTXTSWP(3)
#bit4	BCLR, BSET, BTG, BTSC, BTSS, BTST, BTST.C, BTST.Z, BTSTS, BTSTS.C, BTSTS.Z
#lit4	ASR, LSR, SL
#Slit4	ADD, LAC, SAC, SAC.R
#wid4	BFEXT, BFINS(6)
#lit5	ADD, ADDC, AND, CP(5), CPB(5), IOR, MUL.SU, MUL.UU, SUB, SUBB, SUBBR, SUBR, XOR
#Slit6(1)	SFTAC
#lit8	MOV.B, CP(4), CPB(4)
#lit10	ADD, ADDC, AND, CP, CPB, IOR, RETLW, SUB, SUBB, XOR
#Slit10	MOV
#lit14	DISI, DO(2), LNK, REPEAT(5)
#lit15	DO(3), REPEAT(4)
#lit16	MOV

Note 1: This operand or instruction is only available in dsPIC30F, dsPIC33F, dsPIC33E and dsPIC33C devices.

2: This operand or instruction is only available in dsPIC30F and dsPIC33F devices.

3: This operand or instruction is only available in dsPIC33E and dsPIC33C devices.

4: This operand or instruction is only available in dsPIC33E, dsPIC33C and PIC24E devices.

5: This operand or instruction is only available in dsPIC30F, dsPIC33F, PIC24F and PIC24H devices.

6: This operand or instruction is only available in dsPIC33C devices.

© 2005-2018 Microchip Technology Inc.

The syntax for Immediate Addressing requires that the number sign (#) must immediately precede the constant operand value. The "#" symbol indicates to the assembler that the quantity is a constant. If an out-of-range constant is used with an instruction, the assembler will generate an error. Several examples of Immediate Addressing are shown in Example 4-7.

Example 4-7: Immediate Addressing

```
    PWRSAV  #1                  ; Enter IDLE mode

    ADD.B   #0x10, W0           ; Add 0x10 to W0 (byte mode)
```

Before Instruction:

```
W0 = 0x12A9
```

After Instruction:

```
W0 = 0x12B9
```

```
    XOR     W0, #1, [W1++]      ; Exclusive-OR W0 and 0x1
                                ; Store the result to [W1]
                                ; Post-increment W1
```

Before Instruction:

```
W0 = 0xFFFF
W1 = 0x0890
Data Memory 0x0890 = 0x0032
```

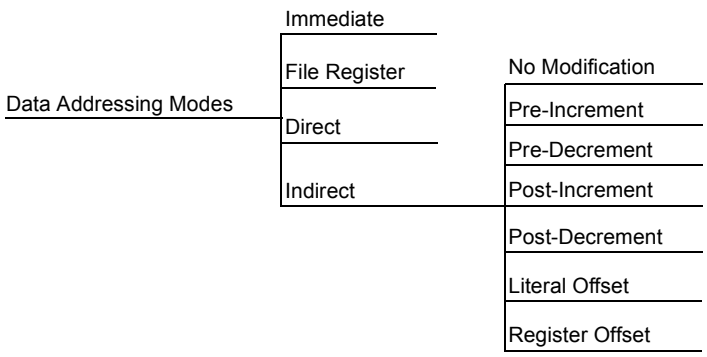
After Instruction:

```
W0 = 0xFFFF
W1 = 0x0892
Data Memory 0x0890 = 0xFFFE
```

4.1.5 Data Addressing Mode Tree

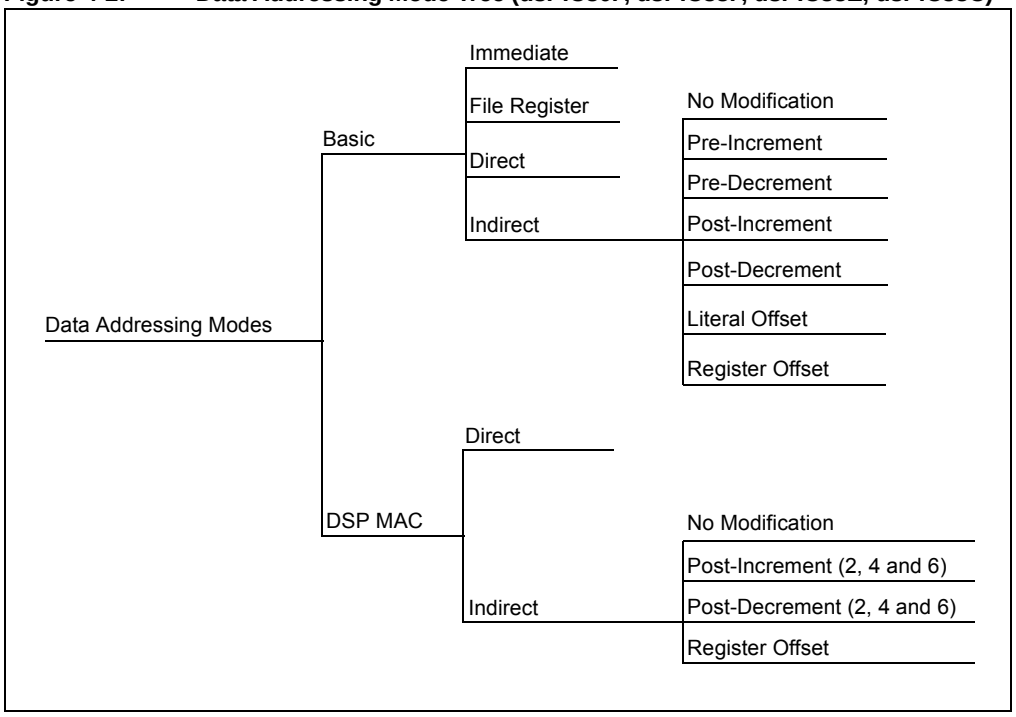
The Data Addressing modes of the PIC24F, PIC24H and PIC24E families are summarized in Figure 4-1.

Figure 4-1: Data Addressing Mode Tree (PIC24F, PIC24H, PIC24E)



The Data Addressing modes of the dsPIC30F, dsPIC33F, dsPIC33E and dsPIC33C are summarized in Figure 4-2.

Figure 4-2: Data Addressing Mode Tree (dsPIC30F, dsPIC33F, dsPIC33E, dsPIC33C)



© 2005-2018 Microchip Technology Inc.

4.2 PROGRAM ADDRESSING MODES

The 16-bit MCU and DSC devices have a 24-bit Program Counter (PC). The PC addresses the 24-bit wide program memory to fetch instructions for execution and it may be loaded in several ways. For byte compatibility with the table read and table write instructions, each instruction word consumes two locations in program memory. This means that during serial execution, the PC is loaded with PC + 2.

Several methods may be used to modify the PC in a non-sequential manner, and both absolute and relative changes may be made to the PC. The change to the PC may be from an immediate value encoded in the instruction or a dynamic value contained in a Working register. In dsPIC30F, dsPIC33F and dsPIC33E devices, when DO looping is active, the PC is loaded with the address stored in the DOSTART register after the instruction at the DOEND address is executed. For exception handling, the PC is loaded with the address of the exception handler, which is stored in the Interrupt Vector Table (IVT). When required, the software stack is used to return scope to the foreground process from where the change in program flow occurred.

Table 4-5 summarizes the instructions which modify the PC. When performing function calls, it is recommended that RCALL be used instead of CALL, since RCALL only consumes one word of program memory.

Table 4-5: Methods of Modifying Program Flow

Condition/Instruction	PC Modification	Software Stack Usage
Sequential Execution	PC = PC + 2	None
BRA Expr(1) (Branch Unconditionally)	PC = PC + 2 * Slit16	None
BRA Condition, Expr(1) (Branch Conditionally)	PC = PC + 2 (condition false) PC = PC + 2 * Slit16 (condition true)	None
CALL Expr(1) (Call Subroutine)	PC = lit23	PC + 4 is PUSHed on the stack(2)
CALL Wn (Call Subroutine Indirect)	PC = Wn	PC + 2 is PUSHed on the stack(2)
CALL.L Wn(5) (Call Indirect Subroutine Long)	PC = {Wn+1:Wn}	PC + 2 is PUSHed on the stack(2)
GOTO Expr(1) (Unconditional Jump)	PC = lit23	None
GOTO Wn (Unconditional Indirect Jump)	PC = Wn	None
GOTO.L Wn(5) (Unconditional Indirect Long Jump)	PC = {Wn+1:Wn}	None
RCALL Expr(1) (Relative Call)	PC = PC + 2 * Slit16	PC + 2 is PUSHed on the stack(2)
RCALL Wn (Computed Relative Call)	PC = PC + 2 * Wn	PC + 2 is PUSHed on the stack(2)
Exception Handling	PC = Address of the exception handler (read from vector table)	PC + 2 is PUSHed on the stack(3)
PC = Target REPEAT instruction (REPEAT Looping)	PC not modified (if REPEAT active)	None
PC = DOEND address(4) (DO Looping)	PC = DOSTART (if DO active)	None

Note 1: For BRA, CALL and GOTO, the Expr may be a label, absolute address or expression, which is resolved by the linker to a 16-bit or 23-bit value (Slit16 or lit23). When representing an address offset value, Expr can also be indicated by using a “.” and a sign, “+” or “-”. For example, the expression, “.+2”, means an address offset of +2 (i.e., the next instruction address relative to the current position of the Program Counter). See **Section 5. “Instruction Descriptions”** for details.

2: After CALL or RCALL is executed, RETURN or RETLW will POP the Top-of-Stack (TOS) back into the PC.

3: After an exception is processed, RETFIE will POP the Top-of-Stack (TOS) back into the PC.

4: This condition/instruction is only available in dsPIC30F, dsPIC33F, dsPIC33E and dsPIC33C devices.

5: This condition instruction is only available in dsPIC33E, dsPIC33C and PIC24E devices.

4.3 INSTRUCTION STALLS

In order to maximize the data space EA calculation and operand fetch time, the X data space read and write accesses are partially pipelined. A consequence of this pipelining is that address register data dependencies may arise between successive read and write operations using common registers.

'Read-After-Write' (RAW) dependencies occur across instruction boundaries and are detected by the hardware. An example of a RAW dependency would be a write operation that modifies W5, followed by a read operation that uses W5 as an Address Pointer. The contents of W5 will not be valid for the read operation until the earlier write completes. This problem is resolved by stalling the instruction execution for one instruction cycle, which allows the write to complete before the next read is started.

4.3.1 RAW Dependency Detection

During the instruction predecode, the core determines if any address register dependency is imminent across an instruction boundary. The Stall detection logic compares the W register (if any) used for the destination EA of the instruction currently being executed with the W register to be used by the source EA (if any) of the prefetched instruction. When a match between the destination and source registers is identified, a set of rules is applied to decide whether or not to stall the instruction by one cycle. Table 4-6 lists various RAW conditions which cause an instruction execution Stall.

Table 4-6: Raw Dependency Rules (Detection By Hardware)

Destination Addressing Mode Using Wn	Source Addressing Mode Using Wn	Stall Required?	Examples(2) (Wn = W2)
Direct	Direct	No Stall	`ADD.W W0, W1, W2` `MOV.W W2, W3`
Indirect	Direct	No Stall	`ADD.W W0, W1, [W2]` `MOV.W W2, W3`
Indirect	Indirect	No Stall	`ADD.W W0, W1, [W2]` `MOV.W [W2], W3`
Indirect	Indirect with Pre/Post-Modification	No Stall	`ADD.W W0, W1, [W2]` `MOV.W [W2++], W3`
Indirect with Pre/Post-Modification	Direct	No Stall	`ADD.W W0, W1, [W2++]` `MOV.W W2, W3`
Direct	Indirect	Stall(1)	`ADD.W W0, W1, W2` `MOV.W [W2], W3`
Direct	Indirect with Pre/Post-Modification	Stall(1)	`ADD.W W0, W1, W2` `MOV.W [W2++], W3`
Indirect	Indirect	Stall(1)	`ADD.W W0, W1, [W2](2)` `MOV.W [W2], W3(2)`
Indirect	Indirect with Pre/Post-Modification	Stall(1)	`ADD.W W0, W1, [W2](2)` `MOV.W [W2++], W3(2)`
Indirect with Pre/Post-Modification	Indirect	Stall(1)	`ADD.W W0, W1, [W2++]` `MOV.W [W2], W3`
Indirect with Pre/Post-Modification	Indirect with Pre/Post-Modification	Stall(1)	`ADD.W W0, W1, [W2++]` `MOV.W [W2++], W3`

Note 1: When Stalls are detected, one cycle is added to the instruction execution time.

2: For these examples, the contents of W2 = the mapped address of W2 (0x0004).

Note: When Register Indirect with Offset Addressing is used to specify the destination for an instruction, and Ws is the same register as Wd, the old value of Ws is used for Wd (i.e., the address offset is ignored).

© 2005-2018 Microchip Technology Inc.

4.3.2 Instruction Stalls and Exceptions

In order to maintain deterministic operation, instruction Stalls are allowed to happen, even if they occur immediately prior to exception processing.

4.3.3 Instruction Stalls and Instructions that Change Program Flow

CALL and RCALL write to the stack using W15 and may, therefore, be subject to an instruction Stall if the source read of the subsequent instruction uses W15.

GOTO, RETFIE and RETURN instructions are never subject to an instruction Stall because they do not perform write operations to the Working registers.

4.3.4 Instruction Stalls and DO/REPEAT Loops

Instructions operating in a DO or REPEAT loop are subject to instruction Stalls, just like any other instruction. Stalls may occur on loop entry, loop exit and also during loop processing.

Note:	DO loops are only available in dsPIC30F, dsPIC33F, dsPIC33E and dsPIC33C devices.

4.3.5 Instruction Stalls and PSV

Instructions operating in PSV address space are subject to instruction Stalls, just like any other instruction. Should a data dependency be detected in the instruction immediately following the PSV data access, the second cycle of the instruction will initiate a Stall. Should a data dependency be detected in the instruction immediately before the PSV data access, the last cycle of the previous instruction will initiate a Stall.

Note:	Refer to the specific device family reference manual for more detailed information about RAW instruction Stalls.

4.4 BYTE OPERATIONS

Since the data memory is byte-addressable, most of the base instructions may operate in either Byte mode or Word mode. When these instructions operate in Byte mode, the following rules apply:

- All direct Working register references use the Least Significant Byte of the 16-bit Working register and leave the Most Significant Byte (MSB) unchanged
- All indirect Working register references use the data byte specified by the 16-bit address stored in the Working register
- All file register references use the data byte specified by the byte address
- The STATUS Register is updated to reflect the result of the byte operation

It should be noted that data addresses are always represented as **byte** addresses. Additionally, the native data format is little-endian, which means that words are stored with the Least Significant Byte at the lower address and the Most Significant Byte at the adjacent, higher address (as shown in Figure 4-3). Example 4-8 shows sample byte move operations and Example 4-9 shows sample byte math operations.

Note: Instructions that operate in Byte mode must use the ".b" or ".B" instruction extension to specify a byte instruction. For example, the following two instructions are valid forms of a byte clear operation:

- `CLR.b W0`
- `CLR.B W0`

Example 4-8: Sample Byte Move Operations

```
    MOV.B   #0x30, W0      ; move the literal byte 0x30 to W0
```

Before Instruction:

```
    W0 = 0x5555
```

After Instruction:

```
    W0 = 0x5530

    MOV.B   0x1000, W0     ; move the byte at 0x1000 to W0
```

Before Instruction:

```
    W0 = 0x5555
    Data Memory 0x1000 = 0x1234
```

After Instruction:

```
    W0 = 0x5534
    Data Memory 0x1000 = 0x1234

    MOV.B   W0, 0x1001     ; byte move W0 to address 0x1001
```

Before Instruction:

```
    W0 = 0x1234
    Data Memory 0x1000 = 0x5555
```

After Instruction:

```
    W0 = 0x1234
    Data Memory 0x1000 = 0x3455

    MOV.B   W0, [W1++]     ; byte move W0 to [W1], then post-inc W1
```

Before Instruction:

```
    W0 = 0x1234
    W1 = 0x1001
    Data Memory 0x1000 = 0x5555
```

After Instruction:

```
    W0 = 0x1234
    W1 = 0x1002
    Data Memory 0x1000 = 0x3455
```

© 2005-2018 Microchip Technology Inc.

Example 4-9: Sample Byte Math Operations

```
    CLR.B   [W6--]             ; byte clear [W6], then post-dec W6
```

Before Instruction:

```
    W6 = 0x1001
    Data Memory 0x1000 = 0x5555
```

After Instruction:

```
    W6 = 0x1000
    Data Memory 0x1000 = 0x0055

    SUB.B   W0, #0x10, W1      ; byte subtract literal 0x10 from W0
                               ; and store to W1
```

Before Instruction:

```
    W0 = 0x1234
    W1 = 0xFFFF
```

After Instruction:

```
    W0 = 0x1234
    W1 = 0xFF24

    ADD.B   W0, W1, [W2++]     ; byte add W0 and W1, store to [W2]
                               ; and post-inc W2
```

Before Instruction:

```
    W0 = 0x1234
    W1 = 0x5678
    W2 = 0x1000
    Data Memory 0x1000 = 0x5555
```

After Instruction:

```
    W0 = 0x1234
    W1 = 0x5678
    W2 = 0x1001
    Data Memory 0x1000 = 0x55AC
```

4.5 WORD MOVE OPERATIONS

Even though the data space is byte-addressable, all move operations made in Word mode must be word-aligned. This means that for all source and destination operands, the Least Significant address bit must be '0'. If a word move is made to or from an odd address, an address error exception is generated. Likewise, all double words must be word-aligned. Figure 4-3 shows how bytes and words may be aligned in data memory. Example 4-10 contains several legal word move operations.

When an exception is generated due to a misaligned access, the exception is taken after the instruction executes. If the illegal access occurs from a data read, the operation will be allowed to complete, but the Least Significant bit of the source address will be cleared to force word alignment. If the illegal access occurs during a data write, the write will be inhibited. Example 4-11 contains several illegal word move operations.

Figure 4-3: Data Alignment in Memory

0x1001		**b0**	0x1000
0x1003	**b1**		0x1002
0x1005	**b3**	**b2**	0x1004
0x1007	**b5**	**b4**	0x1006
0x1009	**b7**	**b6**	0x1008
0x100B		**b8**	0x100A

Legend:
b0 – byte stored at 0x1000
b1 – byte stored at 0x1003
b3:b2 – word stored at 0x1005:1004 (b2 is LSB)
b7:b4 – double word stored at 0x1009:0x1006 (b4 is LSB)
b8 – byte stored at 0x100A

Note: Instructions that operate in Word mode are not required to use an instruction extension. However, they may be specified with an optional ".w" or ".W" extension, if desired. For example, the following instructions are valid forms of a word clear operation:

- `CLR W0`
- `CLR.w W0`
- `CLR.W W0`

© 2005-2018 Microchip Technology Inc.

Example 4-10: Legal Word Move Operations

```
    MOV     #0x30, W0          ; move the literal word 0x30 to W0
```

Before Instruction:

```
    W0 = 0x5555
```

After Instruction:

```
    W0 = 0x0030

    MOV     0x1000, W0         ; move the word at 0x1000 to W0
```

Before Instruction:

```
    W0 = 0x5555
    Data Memory 0x1000 = 0x1234
```

After Instruction:

```
    W0 = 0x1234
    Data Memory 0x1000 = 0x1234

    MOV     [W0], [W1++]       ; word move [W0] to [W1],
                               ; then post-inc W1
```

Before Instruction:

```
    W0 = 0x1234
    W1 = 0x1000
    Data Memory 0x1000 = 0x5555
    Data Memory 0x1234 = 0xAAAA
```

After Instruction:

```
    W0 = 0x1234
    W1 = 0x1002
    Data Memory 0x1000 = 0xAAAA
    Data Memory 0x1234 = 0xAAAA
```

Example 4-11: Illegal Word Move Operations

```
    MOV     0x1001, W0          ; move the word at 0x1001 to W0
```

Before Instruction:

```
W0 = 0x5555
Data Memory 0x1000 = 0x1234
Data Memory 0x1002 = 0x5678
```

After Instruction:

```
W0 = 0x1234
Data Memory 0x1000 = 0x1234
Data Memory 0x1002 = 0x5678
```

ADDRESS ERROR TRAP GENERATED

(source address is misaligned, so MOV is performed)

```
    MOV     W0, 0x1001          ; move W0 to the word at 0x1001
```

Before Instruction:

```
W0 = 0x1234
Data Memory 0x1000 = 0x5555
Data Memory 0x1002 = 0x6666
```

After Instruction:

```
W0 = 0x1234
Data Memory 0x1000 = 0x5555
Data Memory 0x1002 = 0x6666
```

ADDRESS ERROR TRAP GENERATED

(destination address is misaligned, so MOV is not performed)

```
    MOV     [W0], [W1++]        ; word move [W0] to [W1],
                                ; then post-inc W1
```

Before Instruction:

```
W0 = 0x1235
W1 = 0x1000
Data Memory 0x1000 = 0x1234
Data Memory 0x1234 = 0xAAAA
Data Memory 0x1236 = 0xBBBB
```

After Instruction:

```
W0 = 0x1235
W1 = 0x1002
Data Memory 0x1000 = 0xAAAA
Data Memory 0x1234 = 0xAAAA
Data Memory 0x1236 = 0xBBBB
```

ADDRESS ERROR TRAP GENERATED

4.6 USING 10-BIT LITERAL OPERANDS

Several instructions that support Byte and Word mode have 10-bit operands. For byte instructions, a 10-bit literal is too large to use. So when 10-bit literals are used in Byte mode, the range of the operand must be reduced to eight bits or the assembler will generate an error. Table 4-7 shows that the range of a 10-bit literal is 0:1023 in Word mode and 0:255 in Byte mode.

Instructions which employ 10-bit literals in Byte and Word mode are: ADD, ADDC, AND, IOR, RETLW, SUB, SUBB and XOR. Example 4-12 shows how positive and negative literals are used in Byte mode for the ADD instruction.

Table 4-7: 10-Bit Literal Coding

Literal Value	Word Mode kk kkkk kkkk	Byte Mode kkkk kkkk
0	00 0000 0000	0000 0000
1	00 0000 0001	0000 0001
2	00 0000 0010	0000 0010
127	00 0111 1111	0111 1111
128	00 1000 0000	1000 0000
255	00 1111 1111	1111 1111
256	01 0000 0000	N/A
512	10 0000 0000	N/A
1023	11 1111 1111	N/A

Example 4-12: Using 10-Bit Literals for Byte Operands

```
ADD.B   #0x80, W0       ; add 128 (or -128) to W0
ADD.B   #0x380, W0      ; ERROR... Illegal syntax for byte mode
ADD.B   #0xFF, W0       ; add 255 (or -1) to W0
ADD.B   #0x3FF, W0      ; ERROR... Illegal syntax for byte mode
ADD.B   #0xF, W0        ; add 15 to W0
ADD.B   #0x7F, W0       ; add 127 to W0
ADD.B   #0x100, W0      ; ERROR... Illegal syntax for byte mode
```

Note: Using a literal value greater than 127 in Byte mode is functionally identical to using the equivalent negative two's complement value, since the Most Significant bit of the byte is set. When operating in Byte mode, the assembler will accept either a positive or negative literal value (i.e., #-10).

4.7 BIT FIELD INSERT/EXTRACT INSTRUCTIONS (dsPIC33C DEVICES ONLY)

The dsPIC33C family provides a set of instructions that operate on bit fields within a target word.

4.7.1 BFEXT

This instruction can extract multiple bits from a W register or data memory location into a destination W register.

4.7.2 BFINS

This instruction can insert multiple bits from a source W register, or 8-bit literal value into a W register or data memory location.

In both instructions, the location and width of the bit field within the target word are defined as literal values within the instruction.

© 2005-2018 Microchip Technology Inc.

4.8 SOFTWARE STACK POINTER AND FRAME POINTER

4.8.1 Software Stack Pointer

The 16-bit MCU and DSC devices feature a software stack which facilitates function calls and exception handling. W15 is the default Stack Pointer (SP) and after any Reset, it is initialized to 0x0800 (0x1000 for PIC24E, dsPIC33E and dsPIC33C devices). This ensures that the SP will point to valid RAM and permits stack availability for exceptions, which may occur before the SP is set by the user software. The user may reprogram the SP during initialization to any location within data space.

The SP always points to the first available free word (Top-of-Stack) and fills the software stack, working from lower addresses towards higher addresses. It pre-decrements for a stack POP (read) and post-increments for a stack PUSH (write).

The software stack is manipulated using the PUSH and POP instructions. The PUSH and POP instructions are the equivalent of a MOV instruction with W15 used as the destination pointer. For example, the contents of W0 can be PUSHed onto the Top-of-Stack (TOS) by:

```
PUSH W0
```

This syntax is equivalent to:

```
MOV W0,[W15++]
```

The contents of the TOS can be returned to W0 by:

```
POP W0
```

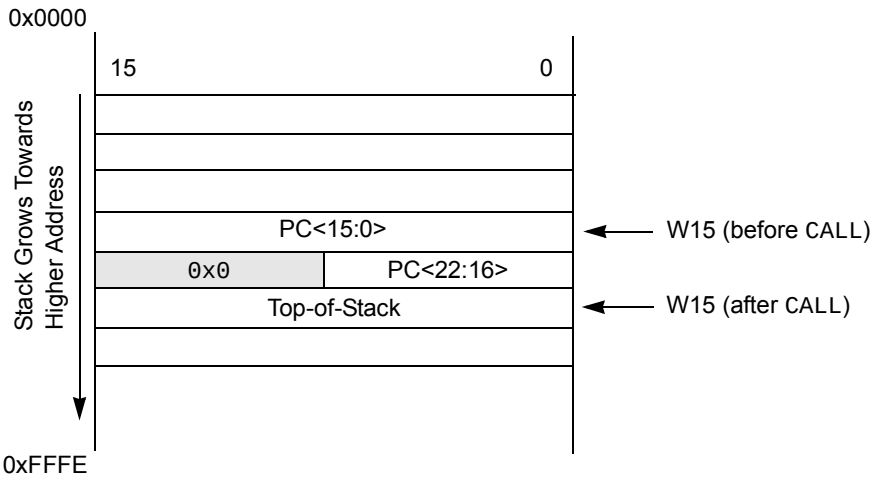
This syntax is equivalent to:

```
MOV [--W15],W0
```

During any CALL instruction, the PC is PUSHed onto the stack, such that when the subroutine completes execution, program flow may resume from the correct location. When the PC is PUSHed onto the stack, PC<15:0> are PUSHed onto the first available stack word, then PC<22:16> are PUSHed. When PC<22:16> are PUSHed, the Most Significant seven bits of the PC are zero-extended before the PUSH is made, as shown in Figure 4-4. During exception processing, the Most Significant seven bits of the PC are concatenated with the lower byte of the STATUS Register (SRL) and IPL<3> (CORCON<3>). This allows the primary STATUS Register contents and CPU Interrupt Priority Level to be automatically preserved during interrupts.

Note:	In order to protect against misaligned stack accesses, W15<0> is always clear.

Figure 4-4: Stack Operation for CALL Instruction



Note: For exceptions, the upper nine bits of the second PUSHed word contains the SRL and IPL<3>.

© 2005-2018 Microchip Technology Inc.

4.8.1.1 STACK POINTER EXAMPLE

Figure 4-5 through Figure 4-8 show how the software stack is modified for the code snippet shown in Example 4-13. Figure 4-5 shows the software stack before the first PUSH has executed. Note that the SP has the initialized value of 0x0800. Furthermore, the example loads 0x5A5A and 0x3636 to W0 and W1, respectively. The stack is PUSHed for the first time in Figure 4-6 and the value contained in W0 is copied to TOS. W15 is automatically updated to point to the next available stack location and the new TOS is 0x0802. In Figure 4-7, the contents of W1 are PUSHed onto the stack and the new TOS becomes 0x0804. In Figure 4-8, the stack is POPped, which copies the last PUSHed value (W1) to W3. The SP is decremented during the POP operation and at the end of the example, the final TOS is 0x0802.

Example 4-13: Stack Pointer Usage

```
MOV     #0x5A5A, W0     ; Load W0 with 0x5A5A
MOV     #0x3636, W1     ; Load W1 with 0x3636
PUSH    W0              ; Push W0 to TOS (see Figure 4-5)
PUSH    W1              ; Push W1 to TOS (see Figure 4-7)
POP     W3              ; Pop TOS to W3 (see Figure 4-8)
```

Figure 4-5: Stack Pointer Before the First PUSH

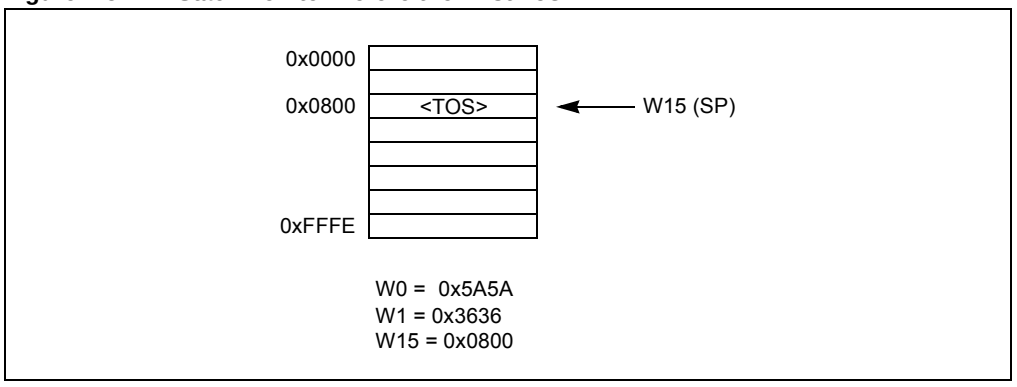


Figure 4-6: Stack Pointer After "PUSH W0" Instruction

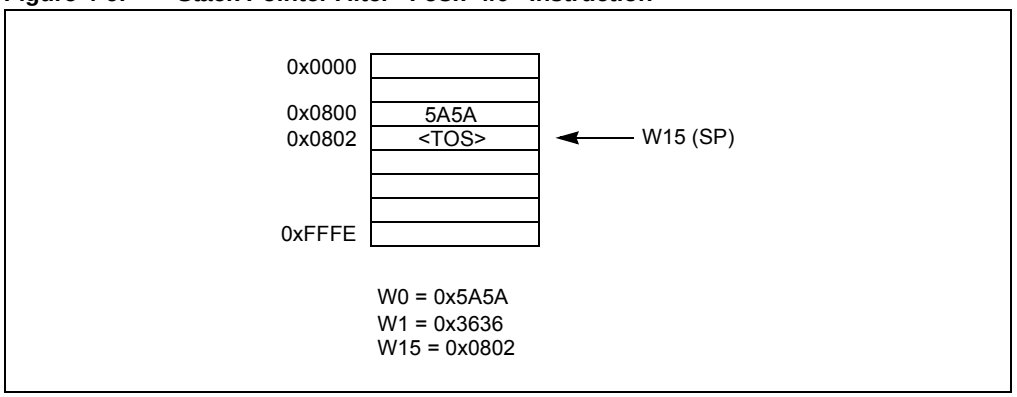

Figure 4-7: Stack Pointer After "PUSH W1" Instruction

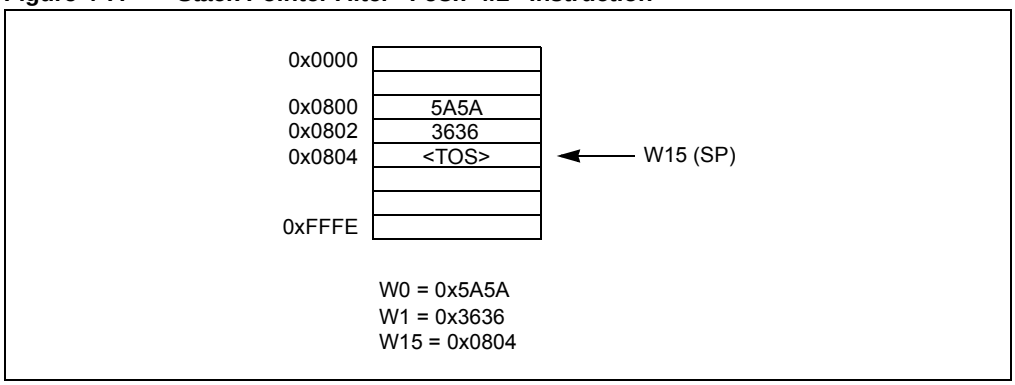

Figure 4-8: Stack Pointer After "POP W3" Instruction

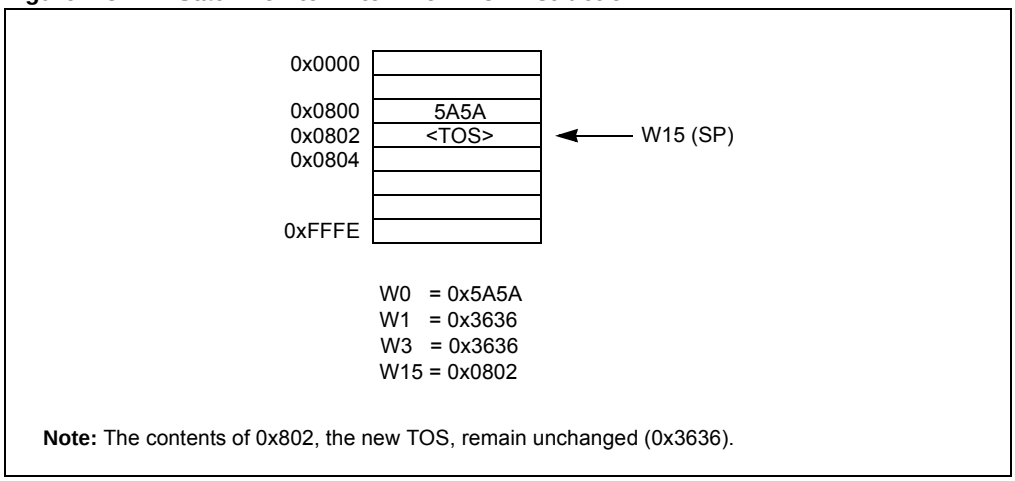

Note: The contents of 0x802, the new TOS, remain unchanged (0x3636).

4.8.2 Software Stack Frame Pointer

A stack frame is a user-defined section of memory residing in the software stack. It is used to allocate memory for temporary variables, which a function uses, and one stack frame may be created for each function. W14 is the default Stack Frame Pointer (FP) and it is initialized to 0x0000 on any Reset. If the Stack Frame Pointer is not used, W14 may be used like any other Working register.

The Link (LNK) and Unlink (ULNK) instructions provide stack frame functionality. The LNK instruction is used to create a stack frame. It is used during a call sequence to adjust the SP, such that the stack may be used to store temporary variables utilized by the called function. After the function completes execution, the ULNK instruction is used to remove the stack frame created by the LNK instruction. The LNK and ULNK instructions must always be used together to avoid stack overflow.

© 2005-2018 Microchip Technology Inc.

4.8.2.1 STACK FRAME POINTER EXAMPLE

Figure 4-9 through Figure 4-11 show how a stack frame is created and removed for the code snippet shown in Example 4-14. This example demonstrates how a stack frame operates and is not indicative of the code generated by the compiler. Figure 4-9 shows the stack condition at the beginning of the example, before any registers are pushed to the stack. Here, W15 points to the first free stack location (TOS) and W14 points to a portion of stack memory allocated for the routine that is currently executing.

Before calling the function, "COMPUTE", the parameters of the function (W0, W1 and W2) are PUSHed on the stack. After the "CALL COMPUTE" instruction is executed, the PC changes to the address of "COMPUTE" and the return address of the function, "TASKA", is placed on the stack (Figure 4-10). Function "COMPUTE" then uses the "LNK #4" instruction to PUSH the calling routine's Frame Pointer value onto the stack and the new Frame Pointer will be set to point to the current Stack Pointer. Then, the literal 4 is added to the Stack Pointer address in W15, which reserves memory for two words of temporary data (Figure 4-11).

Inside the function, "COMPUTE", the FP is used to access the function parameters and temporary (local) variables. [W14 + n] will access the temporary variables used by the routine and [W14 – n] is used to access the parameters. At the end of the function, the ULNK instruction is used to copy the Frame Pointer address to the Stack Pointer and then POP the calling subroutine's Frame Pointer back to the W14 register. The ULNK instruction returns the stack back to the state shown in Figure 4-10.

A RETURN instruction will return to the code that called the subroutine. The calling code is responsible for removing the parameters from the stack. The RETURN and POP instructions restore the stack to the state shown in Figure 4-9.

Example 4-14: Frame Pointer Usage

```
TASKA:
    ...
    PUSH    W0          ; Push parameter 1
    PUSH    W1          ; Push parameter 2
    PUSH    W2          ; Push parameter 3
    CALL    COMPUTE     ; Call COMPUTE function
    POP     W2          ; Pop parameter 3
    POP     W1          ; Pop parameter 2
    POP     W0          ; Pop parameter 1
    ...

COMPUTE:
    LNK   #4            ; Stack FP, allocate 4 bytes for local variables
    ...
    ULNK                ; Free allocated memory, restore original FP
    RETURN              ; Return to TASKA
```

Figure 4-9: Stack at the Beginning of Example 4-14

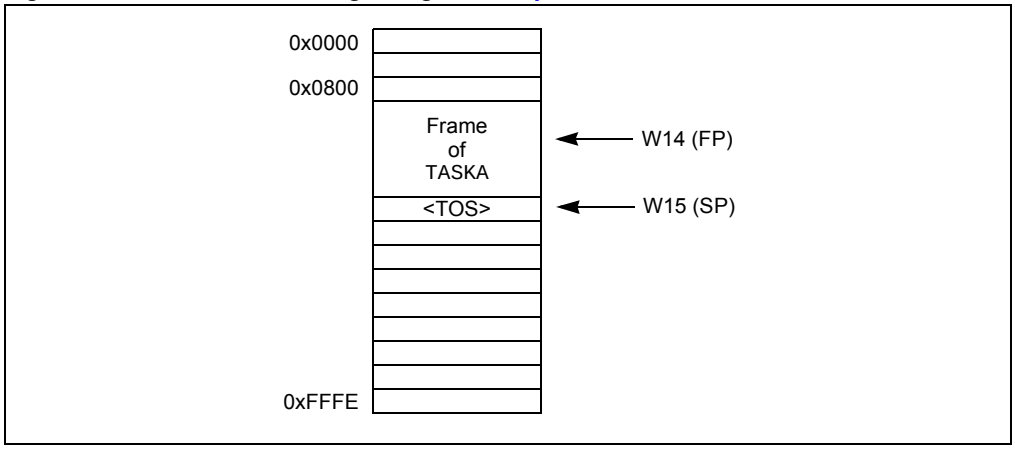

Figure 4-10: Stack After "CALL COMPUTE" Executes

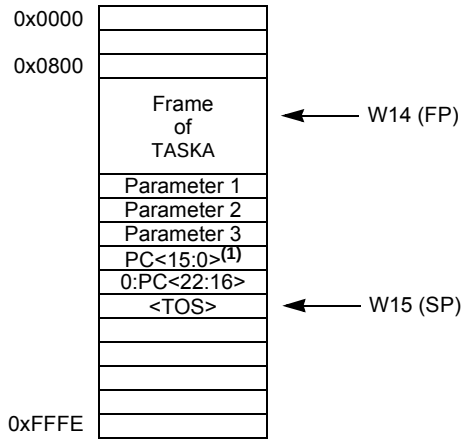
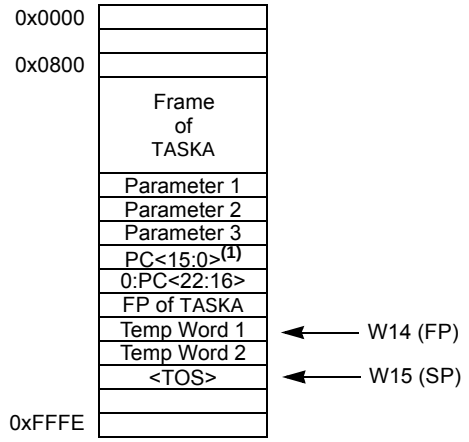


Note 1: In dsPIC33E/PIC24E devices, the SFA bit is stacked instead of PC<0>.

Figure 4-11: Stack After "LNK #4" Executes



Note 1: In dsPIC33E/PIC24E devices, the SFA bit is stacked instead of PC<0>.

4.8.3 Stack Pointer Overflow

There is a Stack Limit register (SPLIM) associated with the Stack Pointer that is reset to 0x0000. SPLIM is a 16-bit register, but SPLIM<0> is fixed to '0', because all stack operations must be word-aligned.

The stack overflow check will not be enabled until a word write to SPLIM occurs; after which time, it can only be disabled by a device Reset. All Effective Addresses generated using W15 as a source or destination are compared against the value in SPLIM. Should the Effective Address be greater than the contents of SPLIM, then a stack error trap is generated.

If stack overflow checking has been enabled, a stack error trap will also occur if the W15 Effective Address calculation wraps over the end of data space (0xFFFF).

Refer to the specific device family reference manual for more information on the stack error trap.

© 2005-2018 Microchip Technology Inc.

4.8.4 Stack Pointer Underflow

The stack is initialized to 0x0800 during Reset (0x1000 for PIC24E, dsPIC33E and dsPIC33C devices). A stack error trap will be initiated should the Stack Pointer address ever be less than 0x0800 (0x1000 for PIC24E, dsPIC33E and dsPIC33C devices).

Note:	Locations in data space, between 0x0000 and 0x07FF (0x0FFF for PIC24E, dsPIC33E and dsPIC33C devices), are in general, reserved for core and peripheral Special Function Registers (SFRs).

4.8.5 Stack Frame Active (SFA) Control (dsPIC33E, dsPIC33C and PIC24E Devices)

W15 is never subject to paging and is therefore restricted to address range, 0x000000 to 0x00FFFF. However, the Stack Frame Pointer (W14) for any user software function is only dedicated to that function when a stack frame addressed by W14 is active (i.e., after a LNK instruction). Therefore, it is desirable to have the ability to dynamically switch W14 between use as a general purpose W register and use as a Stack Frame Pointer. The SFA Status bit (CORCON<2>) achieves this function without additional software overhead.

When the SFA bit is clear, W14 may be used with any page register. When SFA is set, W14 is not subject to paging and is locked into the same address range as W15 (0x000000 to 0x00FFFF). Operation of the SFA register lock is as follows:

- The LNK instruction sets SFA (and creates a stack frame).
- The ULNK instruction clears SFA (and deletes the stack frame).
- The CALL, CALL.L and RCALL instructions also stack the SFA bit (placing it in the LSb of the stacked PC), and clear the SFA bit after the stacking operation is complete. The called procedure is now free to either use W14 as a general purpose register or create another stack frame using the LNK instruction.
- The RETURN, RETLW and RETFIE instructions all restore the SFA bit from its previously stacked value.

The SFA bit is a read-only bit. It can only be set by execution of the LNK instruction, and cleared by the ULNK, CALL, CALL.L and RCALL instructions.

Note:	In dsPIC33E, dsPIC33C and PIC24E devices, the SFA bit is stacked instead of PC<0>.

4.9 CONDITIONAL BRANCH INSTRUCTIONS

Conditional branch instructions are used to direct program flow based on the contents of the STATUS Register. These instructions are generally used in conjunction with a compare class instruction, but they may be employed effectively after any operation that modifies the STATUS Register.

The compare instructions, CP, CP0 and CPB, perform a subtract operation (minuend – subtrahend), but do not actually store the result of the subtraction. Instead, compare instructions just update the flags in the STATUS Register, such that an ensuing conditional branch instruction may change program flow by testing the contents of the updated STATUS Register. If the result of the STATUS Register test is true, the branch is taken. If the result of the STATUS Register test is false, the branch is not taken.

The conditional branch instructions supported by the dsPIC30F, dsPIC33F, dsPIC33E and dsPIC33C devices are shown in Table 4-8. This table identifies the condition in the STATUS Register which must be true for the branch to be taken. In some cases, just a single bit is tested (as in BRA C), while in other cases, a complex logic operation is performed (as in BRA GT). For dsPIC30F, dsPIC33F, dsPIC33E and dsPIC33C devices, it is worth noting that both signed and unsigned conditional tests are supported, and that support is provided for DSP algorithms with the OA, OB, SA and SB condition mnemonics.

Table 4-8: Conditional Branch Instructions

Condition Mnemonic(1)	Description	Status Test
C	Carry (not Borrow)	C
GE	Signed Greater Than or Equal	($\overline{N}$&&$\overline{OV}$) || (N&&OV)
GEU(2)	Unsigned Greater Than or Equal	C
GT	Signed Greater Than	($\overline{Z}$&&$\overline{N}$&&$\overline{OV}$) || ($\overline{Z}$&&N&&OV)
GTU	Unsigned Greater Than	C&&$\overline{Z}$
LE	Signed Less Than or Equal	Z || ($\overline{N}$&&OV) || (N&&$\overline{OV}$)
LEU	Unsigned Less Than or Equal	$\overline{C}$ || Z
LT	Signed Less Than	($\overline{N}$&&OV) || (N&&$\overline{OV}$)
LTU(3)	Unsigned Less Than	C
N	Negative	N
NC	Not Carry (Borrow)	C
NN	Not Negative	N
NOV	Not Overflow	OV
NZ	Not Zero	Z
OA(4)	Accumulator A Overflow	OA
OB(4)	Accumulator B Overflow	OB
OV	Overflow	OV
SA(4)	Accumulator A Saturate	SA
SB(4)	Accumulator B Saturate	SB
Z	Zero	Z

Note 1: Instructions are of the form: BRA mnemonic, Expr.

2: GEU is identical to C and will reverse assemble to BRA C, Expr.

3: LTU is identical to NC and will reverse assemble to BRA NC, Expr.

4: This condition is only available in dsPIC30F, dsPIC33F, dsPIC33E and dsPIC33C devices.

Note: The "Compare and Skip" instructions (CPBEQ, CPBGT, CPBLT, CPBNE, CPSEQ, CPSGT, CPSLT and CPSNE) do not modify the STATUS Register.

© 2005-2018 Microchip Technology Inc.

4.10 Z STATUS BIT

The Z Status bit is a special Zero Status bit that is useful for extended precision arithmetic. The Z bit functions like a normal Z flag for all instructions, except those that use the Carry/Borrow input (ADDC, CPB, SUBB and SUBBR). For the ADDC, CPB, SUBB and SUBBR instructions, the Z bit can only be cleared and never set. If the result of one of these instructions is non-zero, the Z bit will be cleared and will remain cleared, regardless of the result of subsequent ADDC, CPB, SUBB or SUBBR operations. This allows the Z bit to be used for performing a simple zero check on the result of a series of extended precision operations.

A sequence of instructions working on multiprecision data (starting with an instruction with no Carry/Borrow input) will automatically logically AND the successive results of the zero test. All results must be zero for the Z flag to remain set at the end of the sequence of operations. If the result of the ADDC, CPB, SUBB or SUBBR instruction is non-zero, the Z bit will be cleared and remain cleared for all subsequent ADDC, CPB, SUBB or SUBBR instructions. Example 4-15 shows how the Z bit operates for a 32-bit addition. It shows how the Z bit is affected for a 32-bit addition implemented with an ADD/ADDC instruction sequence. The first example generates a zero result for only the most significant word, and the second example generates a zero result for both the least significant word and most significant word.

Example 4-15: 'Z' Status Bit Operation for 32-Bit Addition

```
    ; Add two doubles (W0:W1 and W2:W3)
    ; Store the result in W5:W4
    ADD     W0, W2, W4      ; Add LSWord and store to W4
    ADDC    W1, W3, W5      ; Add MSWord and store to W5
```

Before 32-Bit Addition (zero result for the most significant word):

```
    W0 = 0x2342
    W1 = 0xFFF0
    W2 = 0x39AA
    W3 = 0x0010
    W4 = 0x0000
    W5 = 0x0000
    SR = 0x0000
```

After 32-Bit Addition:

```
    W0 = 0x2342
    W1 = 0xFFF0
    W2 = 0x39AA
    W3 = 0x0010
    W4 = 0x5CEC
    W5 = 0x0000
    SR = 0x0201 (DC,C=1)
```

Before 32-Bit Addition (zero result for the least significant word and most significant word):

```
    W0 = 0xB76E
    W1 = 0xFB7B
    W2 = 0x4892
    W3 = 0x0484
    W4 = 0x0000
    W5 = 0x0000
    SR = 0x0000
```

After 32-Bit Addition:

```
    W0 = 0xB76E
    W1 = 0xFB7B
    W2 = 0x4892
    W3 = 0x0485
    W4 = 0x0000
    W5 = 0x0000
    SR = 0x0103 (DC,Z,C=1)
```

© 2005-2018 Microchip Technology Inc.

4.11 ASSIGNED WORKING REGISTER USAGE

The 16 Working registers of the 16-bit MCU and DSC devices provide a large register set for efficient code generation and algorithm implementation. In an effort to maintain an instruction set that provides advanced capability, a stable run-time environment and backwards compatibility with earlier Microchip processor cores, some Working registers have a preassigned usage. Table 4-9 summarizes these Working register assignments. For the dsPIC30F, dsPIC33F, dsPIC33E and dsPIC33C, additional details are provided in subsections, **Section 4.11.1 "Implied DSP Operands (dsPIC30F, dsPIC33F, dsPIC33E and dsPIC33C Devices)"** through **Section 4.11.3 "PIC® Microcontroller Compatibility"**.

Table 4-9: Special Working Register Assignments

Register	Special Assignment
W0	Default WREG, Divide Quotient for DIV instructions
W1	Divide Remainder for DIV instructions
W2	"MUL f" Product least significant word
W3	"MUL f" Product most significant word
W4	MAC Operand(1)
W5	MAC Operand(1)
W6	MAC Operand(1)
W7	MAC Operand(1)
W8	MAC Prefetch Address (X Memory)(1)
W9	MAC Prefetch Address (X Memory)(1)
W10	MAC Prefetch Address (Y Memory)(1)
W11	MAC Prefetch Address (Y Memory)(1)
W12	MAC Prefetch Offset(1)
W13	MAC Write-Back Destination(1)
W14	Frame Pointer
W15	Stack Pointer

Note 1: This assignment is only applicable in dsPIC30F, dsPIC33F, dsPIC33E and dsPIC33C devices.

4.11.1 Implied DSP Operands (dsPIC30F, dsPIC33F, dsPIC33E and dsPIC33C Devices)

To assist instruction encoding and maintain uniformity among the DSP class of instructions, some Working registers have preassigned functionality. For all DSP instructions which have prefetch ability, the following ten register assignments must be adhered to:

- W4-W7 are used for arithmetic operands
- W8-W11 are used for prefetch addresses (pointers)
- W12 is used for the prefetch register offset index
- W13 is used for the accumulator write-back destination

These restrictions only apply to the DSP MAC class of instructions, which utilize Working registers and have prefetch ability (described in **Section 4.16 "DSP Accumulator Instructions (dsPIC30F, dsPIC33F, dsPIC33E and dsPIC33C Devices)"**). These instructions are CLR, ED, EDAC, MAC, MOVSAC, MPY, MPY.N and MSC.

In dsPIC33E devices, mixed-sign DSP multiplication operations are supported without the need to dynamically modify the US<1:0> bits. In this mode (US<1:0> = 10), each input operand is treated as unsigned or signed, based on which register is being used for that operand. W4 and W6 are always unsigned operands, whereas W5 and W7 are always signed operands. This feature can be used to efficiently execute extended precision DSP multiplications.

The DSP accumulator class of instructions (described in **Section 4.16 "DSP Accumulator Instructions (dsPIC30F, dsPIC33F, dsPIC33E and dsPIC33C Devices)"**) is not required to follow the Working register assignments in Table 4-9 and may freely use any Working register when required.

© 2005-2018 Microchip Technology Inc.

4.11.2 Implied Frame and Stack Pointer

To accommodate software stack usage, W14 is the implied Frame Pointer (used by the LNK and ULNK instructions) and W15 is the implied Stack Pointer (used by the CALL, LNK, POP, PUSH, RCALL, RETFIE, RETLW, RETURN, TRAP and ULNK instructions). Even though W14 and W15 have this implied usage, they may still be used as generic operands in any instruction with the exceptions outlined in **Section 4.11.1 "Implied DSP Operands (dsPIC30F, dsPIC33F, dsPIC33E and dsPIC33C Devices)"**. If W14 and W15 must be used for other purposes (it is strongly advised that they remain reserved for the Frame and Stack Pointers), extreme care must be taken such that the run-time environment is not corrupted.

4.11.3 PIC® Microcontroller Compatibility

4.11.3.1 DEFAULT WORKING REGISTER (WREG)

To ease the migration path for users of the Microchip 8-bit PIC MCU families, the 16-bit MCU and DSC devices have matched the functionality of the PIC MCU instruction sets as closely as possible. One major difference between the 16-bit MCU and DSC, and the 8-bit PIC MCU processors is the number of Working registers provided. The 8-bit PIC MCU families only provide one 8-bit Working register, while the 16-bit MCU and DSC families provide sixteen, 16-bit Working registers. To accommodate for the one Working register of the 8-bit PIC MCU, the 16-bit MCU and DSC device instruction set has designated one Working register to be the default Working register for all legacy file register instructions. The default Working register is set to W0 and it is used by all instructions which use File Register Addressing.

Additionally, the syntax used by the 16-bit MCU and DSC device assembler to specify the default Working register is similar to that used by the 8-bit PIC MCU assembler. As shown in the detailed instruction descriptions in **Section 5. "Instruction Descriptions"**, "WREG" must be used to specify the default Working register. Example 4-16 shows several instructions that use WREG.

Example 4-16: Using the Default Working Register, WREG

```
ADD     RAM100          ; add RAM100 and WREG, store in RAM100
ASR     RAM100, WREG    ; shift RAM100 right, store in WREG
CLR.B   WREG            ; clear the WREG LS Byte
DEC     RAM100, WREG    ; decrement RAM100, store in WREG
MOV     WREG, RAM100    ; move WREG to RAM100
SETM    WREG            ; set all bits in the WREG
XOR     RAM100          ; XOR RAM100 and WREG, store in RAM100
```

4.11.3.2 PRODH:PRODL REGISTER PAIR

Another significant difference between the Microchip 8-bit PIC MCU and 16-bit MCU and DSC architectures is the multiplier. Some PIC MCU families support an 8-bit x 8-bit multiplier, which places the multiply product in the PRODH:PRODL register pair. The 16-bit MCU and DSC devices have a 17-bit x 17-bit multiplier, which may place the result into any two successive Working registers (starting with an even register) or an accumulator.

Despite this architectural difference, the 16-bit MCU and DSC devices still support the legacy file register multiply instruction (MULWF) with the "MUL{.B} f" instruction (described on page 323). Supporting the legacy MULWF instruction has been accomplished by mapping the PRODH:PRODL registers to the Working register pair W3:W2. This means that when "MUL{.B} f" is executed in Word mode, the multiply generates a 32-bit product which is stored in W3:W2, where W3 has the most significant word of the product and W2 has the least significant word of the product. When "MUL{.B} f" is executed in Byte mode, the 16-bit product is stored in W2 and W3 is unaffected. Examples of this instruction are shown in Example 4-17.

Example 4-17: Unsigned f and WREG Multiply (Legacy MULWF Instruction)

```
    MUL.B   0x100       ; (0x100)*WREG (byte mode), store to W2
```

Before Instruction:

```
    W0 (WREG) = 0x7705
    W2 = 0x1235
    W3 = 0x1000
    Data Memory 0x0100 = 0x1255
```

After Instruction:

```
    W0 (WREG) = 0x7705
    W2 = 0x01A9
    W3 = 0x1000
    Data Memory 0x0100 = 0x1255

    MUL     0x100       ; (0x100)*WREG (word mode), store to W3:W2
```

Before Instruction:

```
    W0 (WREG) = 0x7705
    W2 = 0x1235
    W3 = 0x1000
    Data Memory 0x0100 = 0x1255
```

After Instruction:

```
    W0 (WREG) = 0x7705
    W2 = 0xDEA9
    W3 = 0x0885
    Data Memory 0x0100 = 0x1255
```

4.11.3.3 MOVING DATA WITH WREG

The "MOV{.B} f {,WREG}" instruction (described on page 299) and "MOV{.B} WREG, f" instruction (described on page 300) allow for byte or word data to be moved between file register memory and the WREG (Working register, W0). These instructions provide equivalent functionality to the legacy Microchip PIC MCU MOVF and MOVWF instructions.

The "MOV{.B} f {,WREG}" and "MOV{.B} WREG, f" instructions are the only MOV instructions which support moves of byte data to and from file register memory. Example 4-18 shows several MOV instruction examples using the WREG.

Note: When moving word data between file register memory and the Working register array, the "MOV Wns, f" and "MOV f, Wnd" instructions allow any Working register (W0:W15) to be used as the source or destination register, not just WREG.

Example 4-18: Moving Data with WREG

```
MOV.B   0x1001, WREG    ; move the byte stored at location 0x1001 to W0
MOV     0x1000, WREG    ; move the word stored at location 0x1000 to W0
MOV.B   WREG, TBLPAG    ; move the byte stored at W0 to the TBLPAG register
MOV     WREG, 0x804     ; move the word stored at W0 to location 0x804
```

4.12 DSP DATA FORMATS (dsPIC30F, dsPIC33F, dsPIC33E AND dsPIC33C DEVICES)

4.12.1 Integer and Fractional Data

The dsPIC30F, dsPIC33F, dsPIC33E and dsPIC33C devices support both integer and fractional data types. Integer data is inherently represented as a signed two's complement value, where the Most Significant bit is defined as a sign bit. Generally speaking, the range of an N-bit two's complement integer is -2^{N-1} to $2^{N-1} - 1$. For a 16-bit integer, the data range is -32768 (0x8000) to 32767 (0x7FFF), including '0'. For a 32-bit integer, the data range is -2,147,483,648 (0x8000 0000) to 2,147,483,647 (0x7FFF FFFF).

Fractional data is represented as a two's complement number, where the Most Significant bit is defined as a sign bit and the radix point is implied to lie just after the sign bit. This format is commonly referred to as 1.15 (or Q15) format, where 1 is the number of bits used to represent the integer portion of the number and 15 is the number of bits used to represent the fractional portion. The range of an N-bit two's complement fraction with this implied radix point is -1.0 to $(1 - 2^{1-N})$. For a 16-bit fraction, the 1.15 data range is -1.0 (0x8000) to 0.999969482 (0x7FFF), including 0.0 and it has a precision of 3.05176×10^{-5}. In Normal Saturation mode, the 32-bit accumulators use a 1.31 format, which enhances the precision to 4.6566×10^{-10}.

The dynamic range of the accumulators can be expanded by using the eight bits of the Upper Accumulator register (ACCxU) as guard bits. Guard bits are used if the value stored in the accumulator overflows beyond the 32nd bit and they are useful for implementing DSP algorithms. This mode is enabled when the ACCSAT bit (CORCON<4>) is set to '1' and it expands the accumulators to 40 bits. The guard bits are also used when the accumulator saturation is disabled. The accumulators then support an integer range of -5.498×10^{11} (0x80 0000 0000) to 5.498×10^{11} (0x7F FFFF FFFF). In Fractional mode, the guard bits of the accumulator do not modify the location of the radix point and the 40-bit accumulators use a 9.31 fractional format. Note that all fractional operation results are stored in the 40-bit accumulator, justified with a 1.31 radix point. As in Integer mode, the guard bits merely increase the dynamic range of the accumulator. 9.31 fractions have a range of -256.0 (0x80 0000 0000) to $(256.0 - 4.65661 \times 10^{-10})$ (0x7F FFFF FFFF). Table 4-10 identifies the range and precision of integers and fractions on the dsPIC30F/33F/33E/33C devices for 16-bit, 32-bit and 40-bit registers.

It should be noted that, with the exception of DSP multiplies, the ALU operates identically on integer and fractional data. Namely, an addition of two integers will yield the same result (binary number) as the addition of two fractional numbers. The only difference is how the result is interpreted by the user. However, multiplies performed by DSP operations are different. In these instructions, data format selection is made by the IF bit (CORCON<0>) and it must be set accordingly ('0' for Fractional mode, '1' for Integer mode). This is required because of the implied radix point used by dsPIC30F/33F/33E/33C fractional numbers. In Integer mode, multiplying two 16-bit integers produces a 32-bit integer result. However, multiplying two 1.15 values generates a 2.30 result. Since the dsPIC30F, dsPIC33F, dsPIC33E and dsPIC33C devices use a 1.31 format for the accumulators, a DSP multiply in Fractional mode also includes a left shift of one bit to keep the radix point properly aligned. This feature reduces the resolution of the DSP multiplier to 2^{-30}, but has no other effect on the computation (e.g., 0.5 x 0.5 = 0.25).

Table 4-10: dsPIC30F/33F/33E/33CData Ranges

Register Size	Integer Range	Fraction Range	Fraction Resolution
16-bit	-32768 to 32767	-1.0 to $(1.0 - 2^{-15})$	3.052×10^{-5}
32-bit	-2,147,483,648 to 2,147,483,647	-1.0 to $(1.0 - 2^{-31})$	4.657×10^{-10}
40-bit	-549,755,813,888 to 549,755,813,887	-256.0 to $(256.0 - 2^{-31})$	4.657×10^{-10}

4.12.2 Integer and Fractional Data Representation

Having a working knowledge of how integer and fractional data is represented on the dsPIC30F, dsPIC33F, dsPIC33E and dsPIC33C is fundamental to working with the devices. Both integer and fractional data treat the Most Significant bit as a sign bit, and the binary exponent decreases by one as the bit position advances toward the Least Significant bit. The binary exponent for an N-bit integer starts at (N-1) for the Most Significant bit and ends at '0' for the Least Significant bit. For an N-bit fraction, the binary exponent starts at '0' for the Most Significant bit and ends at (1-N) for the Least Significant bit (as shown in Figure 4-12 for a positive value and in Figure 4-13 for a negative value).

Conversion between integer and fractional representations can be performed using simple division and multiplication. To go from an N-bit integer to a fraction, divide the integer value by 2^{N-1}. Similarly, to convert an N-bit fraction to an integer, multiply the fractional value by 2^{N-1}.

Figure 4-12: Different Representations of 0x4001

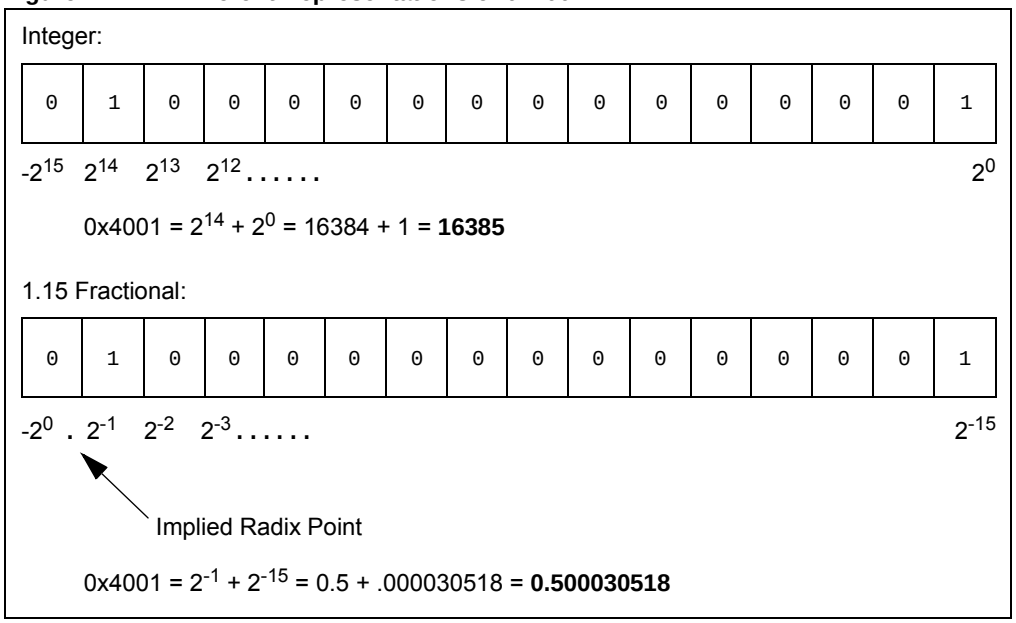

Figure 4-13: Different Representations of 0xC002

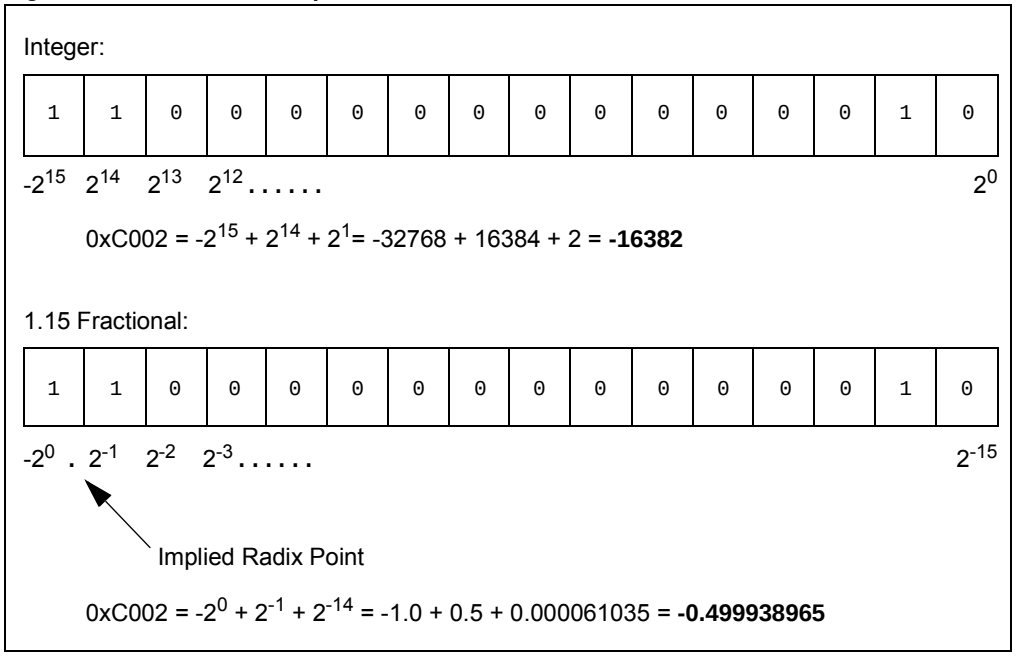


© 2005-2018 Microchip Technology Inc.

4.13 ACCUMULATOR USAGE (dsPIC30F, dsPIC33F, dsPIC33E AND dsPIC33C DEVICES)

Accumulators A and B are utilized by DSP instructions to perform mathematical and shifting operations. Since the accumulators are 40 bits wide, and the X and Y data paths are only 16 bits, the method to load and store the accumulators must be understood.

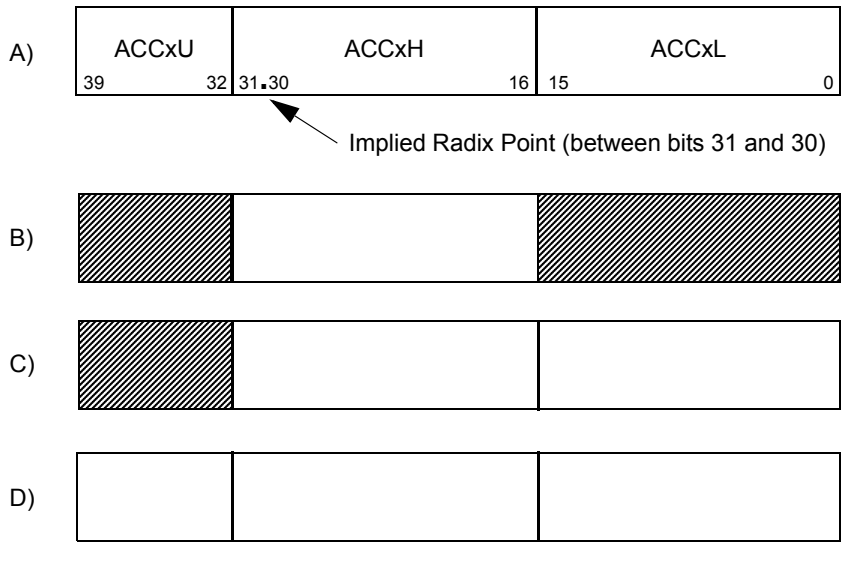
Item A in Figure 4-14 shows that each 40-bit accumulator (ACCA and ACCB) consists of an 8-bit upper register (ACCxU), a 16-bit high register (ACCxH) and a 16-bit low register (ACCxL). To address the bus alignment requirement and provide the ability for 1.31 math, ACCxH is used as a destination register for loading the accumulator (with the LAC instruction), and also as a source register for storing the accumulator (with the SAC.R instruction). This is represented by Item B in Figure 4-14, where the upper and lower portions of the accumulator are shaded. In reality, during accumulator loads, ACCxL is zero backfilled and ACCxU is sign-extended to represent the sign of the value loaded in ACCxH.

Note:	dsPIC33C devices provide double-word LAC.D and SAC.D instructions, which allow both ACCxH and ACCxL to be loaded or stored in a single instruction.

When normal (31-bit) saturation is enabled, DSP operations (such as ADD, MAC, MSC, etc.) solely utilize ACCxH:ACCxL (Item C in Figure 4-14) and ACCxU is only used to maintain the sign of the value stored in ACCxH:ACCxL. For instance, when an MPY instruction is executed, the result is stored in ACCxH:ACCxL and the sign of the result is extended through ACCxU.

When super saturation is enabled, or when saturation is disabled, all registers of the accumulator may be used (Item D in Figure 4-14) and the results of DSP operations are stored in ACCxU:ACCxH:ACCxL. The benefit of ACCxU is that it increases the dynamic range of the accumulator, as described in **Section 4.12.1 "Integer and Fractional Data"**. Refer to Table 4-10 to see the range of values which may be stored in the accumulator when in Normal and Super Saturation modes.

Figure 4-14: Accumulator Alignment and Usage



A) 40-bit accumulator consists of ACCxU:ACCxH:ACCxL
B) Load and store operations
C) Operations in Normal Saturation mode
D) Operations in Super Saturation mode or with saturation disabled

4.14 ACCUMULATOR ACCESS (dsPIC30F, dsPIC33F, dsPIC33E AND dsPIC33C DEVICES)

The six registers of Accumulator A and Accumulator B are memory-mapped like any other Special Function Register. This feature allows them to be accessed with File Register or Indirect Addressing, using any instruction which supports such addressing. However, it is recommended that the DSP instructions, LAC, SAC and SAC.R, be used to load and store the accumulators, since they provide sign-extension, shifting and rounding capabilities. LAC, SAC and SAC.R instruction details are provided in **Section 5. "Instruction Descriptions"**.

Note 1: For convenience, ACCAU and ACCBU are sign-extended to 16 bits. This provides the flexibility to access these registers using either Byte or Word mode (when File Register or Indirect Addressing is used).

2: The OA, OB, SA or SB bit cannot be set by writing overflowed values to the memory-mapped accumulators using MOV instructions, as these Status bits are only affected by DSP operations.

3: dsPIC33C devices provide double-word LAC.D and SAC.D instructions, which allow both ACCxH and ACCxL to be loaded or stored in a single instruction.

4.15 DSP MAC INSTRUCTIONS (dsPIC30F, dsPIC33F, dsPIC33E AND dsPIC33C DEVICES)

The DSP Multiply and Accumulate (MAC) operations are a special suite of instructions which provide the most efficient use of the dsPIC30F, dsPIC33F, dsPIC33E and dsPIC33C architectures. The DSP MAC instructions, shown in Table 4-11, utilize both the X and Y data paths of the CPU core, which enables these instructions to perform the following operations all in one cycle:

- Two reads from data memory using prefetch Working registers (MAC Prefetches)
- Two updates to prefetch Working registers (MAC Prefetch Register Updates)
- One mathematical operation with an accumulator (MAC Operations)

In addition, four of the ten DSP MAC instructions are also capable of performing an operation with one accumulator, while storing out the rounded contents of the alternate accumulator. This feature is called accumulator Write-Back (WB) and it provides flexibility for the software developer. For instance, the Accumulator WB may be used to run two algorithms concurrently, or efficiently process complex numbers, among other things.

Table 4-11: DSP MAC Instructions

Instruction	Description	Accumulator WB?
CLR	Clear Accumulator	Yes
ED	Euclidean Distance (no accumulate)	No
EDAC	Euclidean Distance	No
MAC	Multiply and Accumulate	Yes
MAC	Square and Accumulate	No
MOVSAC	Move from X and Y Bus	Yes
MPY	Multiply to Accumulator	No
MPY	Square to Accumulator	No
MPY.N	Negative Multiply to Accumulator	No
MSC	Multiply and Subtract	Yes

© 2005-2018 Microchip Technology Inc.

4.15.1 MAC Prefetches

Prefetches (or data reads) are made using the Effective Address stored in the Working register. The two prefetches from data memory must be specified using the Working register assignments shown in Table 4-9. One read must occur from the X data bus using W8 or W9, and one read must occur from the Y data bus using W10 or W11. The allowed destination registers for both prefetches are W4-W7.

As shown in Table 4-3, one special addressing mode exists for the MAC class of instructions. This mode is the Register Offset Addressing mode and utilizes W12. In this mode, the prefetch is made using the Effective Address of the specified Working register, plus the 16-bit signed value stored in W12. Register Offset Addressing may only be used in the X space with W9 and in the Y space with W11.

4.15.2 MAC Prefetch Register Updates

After the MAC prefetches are made, the Effective Address stored in each prefetch Working register may be modified. This feature enables efficient single-cycle processing for data stored sequentially in X and Y memory. Since all DSP instructions execute in Word mode, only even numbered updates may be made to the Effective Address stored in the Working register. Allowable address modifications to each prefetch register are -6, -4, -2, 0 (no update), +2, +4 and +6. This means that Effective Address updates may be made up to three words in either direction.

When the Register Offset Addressing mode is used, no update is made to the base prefetch register (W9 or W11) or the offset register (W12).

4.15.3 MAC Operations

The mathematical operations performed by the MAC class of DSP instructions center around multiplying the contents of two Working registers and either adding or storing the result to either Accumulator A or Accumulator B. This is the operation of the MAC, MPY, MPY.N and MSC instructions. Table 4-9 shows that W4-W7 must be used for data source operands in the MAC class of instructions. W4-W7 may be combined in any fashion, and when the same Working register is specified for both operands, a square or square and accumulate operation is performed.

For the ED and EDAC instructions, the same multiplicand operand must be specified by the instruction, because this is the definition of the euclidean distance operation. Another unique feature about this instruction is that the values prefetched from X and Y memory are not actually stored in W4-W7. Instead, only the difference of the prefetched data words is stored in W4-W7.

The two remaining MAC class instructions, CLR and MOVSAC, are useful for initiating or completing a series of MAC or EDAC instructions and do not use the multiplier. CLR has the ability to clear Accumulator A or B, prefetch two values from data memory and store the contents of the other accumulator. Similarly, MOVSAC has the ability to prefetch two values from data memory and store the contents of either accumulator.

4.15.4 MAC Write-Back

The Write-Back ability of the MAC class of DSP instructions facilitates efficient processing of algorithms. This feature allows one mathematical operation to be performed with one accumulator and the rounded contents of the other accumulator to be stored in the same cycle. As indicated in Table 4-9, register W13 is assigned for performing the Write-Back and two addressing modes are supported: Direct and Indirect with Post-Increment.

The CLR, MOVSAC and MSC instructions support accumulator Write-Back, while the ED, EDAC, MPY and MPY.N instructions do not support accumulator Write-Back. The MAC instruction, which multiplies two Working registers which are not the same, also supports accumulator Write-Back. However, the square and accumulate MAC instruction does not support accumulator Write-Back (see Table 4-11).

© 2005-2018 Microchip Technology Inc.

4.15.5 MAC Syntax

The syntax of the MAC class of instructions can have several formats, which depend on the instruction type and the operation it is performing, with respect to prefetches and accumulator Write-Back. With the exception of the CLR and MOVSAC instructions, all MAC class instructions must specify a target accumulator along with two multiplicands, as shown in Example 4-19.

Example 4-19: Base MAC Syntax

```
; MAC with no prefetch
MAC W4*W5, A

; MAC with no prefetch
MAC W7*W7, B
      └──────────────────────► Multiply W7*W7, Accumulate to ACCB
```

If a prefetch is used in the instruction, the assembler is capable of discriminating between the X or Y data prefetch based on the register used for the Effective Address. [W8] or [W9] specifies the X prefetch and [W10] or [W11] specifies the Y prefetch. Brackets around the Working register are required in the syntax and they designate that Indirect Addressing is used to perform the prefetch. When address modification is used, it must be specified using a minus-equals or plus-equals "C"-like syntax (i.e., "[W8] – = 2" or "[W8] + = 6"). When Register Offset Addressing is used for the prefetch, W12 is placed inside the brackets ([W9 + W12] for X prefetches and [W11 + W12] for Y prefetches). Each prefetch operation must also specify a prefetch destination register (W4-W7). In the instruction syntax, the destination register appears before the prefetch register. Legal forms of prefetch are shown in Example 4-20.

Example 4-20: MAC Prefetch Syntax

```
; MAC with X only prefetch
MAC W5*W6, A, [W8]+=2, W5
      └──────────────────► ACCA=ACCA+W5*W6
                 └──────► X([W8]+=2)→W5

; MAC with Y only prefetch
MAC W5*W5, B, [W11+W12], W5
      └──────────────────► ACCB=ACCB+W5*W5
                 └──────► Y([W11+W12])→W5

; MAC with X/Y prefetch
MAC W6*W7, B,  [W9], W6,  [W10]+=4, W7
      └──────────────────► ACCB=ACCB+W6*W7
                 └──────► X([W9])→W6
                        └► Y([W10]+=4)→W7
```

© 2005-2018 Microchip Technology Inc.

If an accumulator Write-Back is used in the instruction, it is specified last. The Write-Back must use the W13 register, and allowable forms for the Write-Back are “W13” for Direct Addressing and “[W13] + = 2” for Indirect Addressing with Post-Increment. By definition, the accumulator not used in the mathematical operation is stored, so the Write-Back accumulator is not specified in the instruction. Legal forms of accumulator Write-Back (WB) are shown in Example 4-21.

Example 4-21: MAC Accumulator WB Syntax

```
; CLR with direct WB of ACCB
CLR A,  W13
        0 → ACCA
        ACCB → W13

; MAC with indirect WB of ACCB
MAC W4*W5, A   [W13]+=2
               ACCA=ACCA+W4*W5
               ACCB → [W13]+=2

; MAC with Y prefetch, direct WB of ACCA
MAC W4*W5, B,  [W10]+=2, W4,  W13
               ACCB=ACCB+W4*W5
                        Y([W10]+=2)→ W4
                        ACCA → W13
```

Putting it all together, an MSC instruction which performs two prefetches and a Write-Back is shown in Example 4-22.

Example 4-22: MSC Instruction with Two Prefetches and Accumulator Write-Back

```
; MSC with X/Y prefetch, indirect WB of ACCA
MSC W6*W7, B, [W8]+=2, W6, [W10]-=6, W7 [W13]+=2
                                        ACCB=ACCB-W6*W7
                                        X([W8]+=2)→W6
                                        Y([W10]-=6)→W7
                                        ACCA→[W13]+=2
```

4.16 DSP ACCUMULATOR INSTRUCTIONS (dsPIC30F, dsPIC33F, dsPIC33E AND dsPIC33C DEVICES)

The DSP accumulator instructions do not have prefetch or accumulator WB ability, but they do provide the ability to add, negate, shift, load and store the contents of either 40-bit accumulator. In addition, the ADD and SUB instructions allow the two accumulators to be added or subtracted from each other. DSP accumulator instructions are shown in Table 4-12 and instruction details are provided in **Section 5. "Instruction Descriptions"**.

Table 4-12: DSP Accumulator Instructions

Instruction	Description	Accumulator WB?
ADD	Add Accumulators	No
ADD	16-Bit Signed Accumulator Add	No
LAC	Load Accumulator	No
LAC.D	Load Accumulator Double Word	No
NEG	Negate Accumulator	No
SAC	Store Accumulator	No
SAC.D	Store Accumulator Double Word	No
SAC.R	Store Rounded Accumulator	No
SFTAC	Arithmetic Shift Accumulator by Literal	No
SFTAC	Arithmetic Shift Accumulator by (Wn)	No
SUB	Subtract Accumulators	No

4.17 SCALING DATA WITH THE FBCL INSTRUCTION (dsPIC30F, dsPIC33F, dsPIC33E AND dsPIC33C DEVICES)

To minimize quantization errors that are associated with data processing using DSP instructions, it is important to utilize the complete numerical result of the operations. This may require scaling data up to avoid underflow (i.e., when processing data from a 12-bit ADC) or scaling data down to avoid overflow (i.e., when sending data to a 10-bit DAC). The scaling, which must be performed to minimize quantization error, depends on the dynamic range of the input data which is operated on and the required dynamic range of the output data. At times, these conditions may be known beforehand and fixed scaling may be employed. In other cases, scaling conditions may not be fixed or known and then dynamic scaling must be used to process data.

The FBCL instruction (Find First Bit Change Left) can efficiently be used to perform dynamic scaling, because it determines the exponent of a value. A fixed point or integer value's exponent represents the amount which the value may be shifted before overflowing. This information is valuable, because it may be used to bring the data value to "full scale", meaning that its numeric representation utilizes all the bits of the register it is stored in.

The FBCL instruction determines the exponent of a word by detecting the first bit change, starting from the value's sign bit and working towards the LSB. Since the dsPIC DSC device's barrel shifter uses negative values to specify a left shift, the FBCL instruction returns the negated exponent of a value. If the value is being scaled up, this allows the ensuing shift to be performed immediately with the value returned by FBCL. Additionally, since the FBCL instruction only operates on signed quantities, FBCL produces results in the range of -15:0. When the FBCL instruction returns 0, it indicates that the value is already at full scale. When the instruction returns -15, it indicates that the value cannot be scaled (as is the case with 0x0 and 0xFFFF). Table 4-13 shows word data with various dynamic ranges, their exponents and the value after scaling each data to maximize the dynamic range. Example 4-23 shows how the FBCL instruction may be used for block processing.

© 2005-2018 Microchip Technology Inc.

Table 4-13: Scaling Examples

Word Value	Exponent	Full-Scale Value (Word Value << Exponent)
0x0001	14	0x4000
0x0002	13	0x4000
0x0004	12	0x4000
0x0100	6	0x4000
0x01FF	6	0x7FC0
0x0806	3	0x4030
0x2007	1	0x400E
0x4800	0	0x4800
0x7000	0	0x7000
0x8000	0	0x8000
0x900A	0	0x900A
0xE001	2	0x8004
0xFF07	7	0x8380

Note: For the word values, 0x0000 and 0xFFFF, the FBCL instruction returns -15.

As a practical example, assume that block processing is performed on a sequence of data with very low dynamic range stored in 1.15 fractional format. To minimize quantization errors, the data may be scaled up to prevent any quantization loss which may occur as it is processed. The FBCL instruction can be executed on the sample with the largest magnitude to determine the optimal scaling value for processing the data. Note that scaling the data up is performed by left shifting the data. This is demonstrated with the code snippet below.

Example 4-23: Scaling with FBCL

```
    ; assume W0 contains the largest absolute value of the data block
    ; assume W4 points to the beginning of the data block
    ; assume the block of data contains BLOCK_SIZE words

    ; determine the exponent to use for scaling
    FBCL    W0, W2              ; store exponent in W2

    ; scale the entire data block before processing
    DO      #(BLOCK_SIZE-1), SCALE
    LAC     [W4], A             ; move the next data sample to ACCA
    SFTAC   A, W2               ; shift ACCA by W2 bits
SCALE:
    SAC     A, [W4++]           ; store scaled input (overwrite original)

    ; now process the data
    ; (processing block goes here)
```

4.18 DATA RANGE LIMIT INSTRUCTIONS (dsPIC33C DEVICES ONLY)

The dsPIC33C family provides special instructions that automatically limit the data in a W register or an accumulator to lie within a user-specified numerical range. These include the FLIM, MAX, MIN and MINZ instructions.

4.18.1 FLIM/FLIM.V

The FLIM instruction simultaneously compares a maximum and a minimum data limit value with the specified W register (or data pointed to by the W register), and clamps the target data to the user-specified limit if the limit is exceeded. SR Status bits are set accordingly for subsequent signed branching. In the FLIM.V instruction, an additional W register is specified, in which the limit test result (known as "limit excess") value is loaded.

4.18.2 MAX/MAX.V

The MAX instruction compares a maximum data limit value (stored in a W register or the other accumulator) with the target accumulator and clamps the target accumulator to the user-specified limit if this upper limit is exceeded. SR Status bits are set accordingly for subsequent signed branching. In the MAX.V instruction, an additional W register (or W register in Indirect Addressing mode) is specified, in which the limit excess value is loaded.

4.18.3 MIN/MIN.V/MINZ

The MIN instruction compares a minimum data limit value (stored in a W register or the other accumulator) with the target accumulator and clamps the target accumulator to the user-specified limit if the data is smaller than this minimum limit. SR Status bits are set accordingly for subsequent signed branching. In the MIN.V instruction, an additional W register (or W register in Indirect Addressing mode) is specified, in which the limit excess value is loaded. The MINZ instruction is simply a conditional version of the MIN instruction, which is executed only when Z = 1.

© 2005-2018 Microchip Technology Inc.

4.19 NORMALIZING THE ACCUMULATOR WITH THE FBCL INSTRUCTION (dsPIC30F, dsPIC33F, dsPIC33E AND dsPIC33C DEVICES)

The process of scaling a quantized value for its maximum dynamic range is known as normalization (the data in the third column in Table 4-13 contains normalized data). Accumulator normalization is a technique used to ensure that the accumulator is properly aligned before storing data from the accumulator and the FBCL instruction facilitates this function.

The two 40-bit accumulators each have eight guard bits from the ACCxU register, which expands the dynamic range of the accumulators from 1.31 to 9.31 when operating in Super Saturation mode (see **Section 4.12.1 "Integer and Fractional Data"**). However, even in Super Saturation mode, the Store Rounded Accumulator (SAC.R) instruction only stores 16-bit data (in 1.15 format) from ACCxH, as described in **Section Figure 4-13: "Different Representations of 0xC002"**. Under certain conditions, this may pose a problem.

Proper data alignment for storing the contents of the accumulator may be achieved by scaling the accumulator down if ACCxU is in use or scaling the accumulator up if all of the ACCxH bits are not being used. To perform such scaling, the FBCL instruction must operate on the ACCxU byte and it must operate on the ACCxH word. If a shift is required, the ALU's 40-bit shifter is employed using the SFTAC instruction to perform the scaling. Example 4-24 contains a code snippet for accumulator normalization.

Note: dsPIC33C devices provide a special NORM (normalize accumulator) instruction, which allows an accumulator to be normalized in a single instruction, eliminating the need to use the FBCL and SFTAC instructions for this purpose.

Example 4-24: Normalizing with FBCL

```
; assume an operation in ACCA has just completed (SR intact)
; assume the processor is in super saturation mode
; assume ACCAH is defined to be the address of ACCAH (0x24)

    MOV     #ACCAH, W5          ; W5 points to ACCAH
    BRA     OA, FBCL_GUARD      ; if overflow we right shift
FBCL_HI:
    FBCL    [W5], W0            ; extract exponent for left shift
    BRA     SHIFT_ACC           ; branch to the shift
FBCL_GUARD:
    FBCL    [++W5], W0          ; extract exponent for right shift
    ADD.B   W0, #15, W0         ; adjust the sign for right shift
SHIFT_ACC:
    SFTAC   A, W0               ; shift ACCA to normalize
```

4.20 NORMALIZING THE ACCUMULATOR WITH THE NORM INSTRUCTION (dsPIC33C DEVICES ONLY)

The NORM instruction automatically normalizes the target accumulator to obtain the largest fractional value possible without overflow. The target accumulator must contain signed fractional data for the instruction result to be valid. It will shift the target accumulator right or left by as many bits as required to normalize the data, keeping the sign consistent. The shift value is stored in a destination address. The N Status bit reflects the direction of the accumulator shift.

If the accumulator cannot be normalized, the accumulator contents will not be affected.

4.21 EXTENDED PRECISION ARITHMETIC USING MIXED-SIGN MULTIPLICATIONS (dsPIC33E AND dsPIC33C ONLY)

Many DSP algorithms utilize extended precision arithmetic operations (operations with 32-bit or 64-bit operands and results) to enhance the resolution and accuracy of computations. These can be implemented using 16-bit signed or unsigned multiplications; however, this would require some additional processing and shifting of the data to obtain the correct results. To enable such extended precision algorithms to be computed faster, dsPIC33E devices support an optional implicit Mixed-Sign Multiplication mode, which is selected by setting US<1:0> (CORCON<13:12>) = 10.

In this mode, mixed-sign (unsigned x signed and signed x unsigned) multiplications can be performed without the need to dynamically reconfigure the US<1:0> bits and shift data to account for the difference in operand formats. Moreover, signed x signed and unsigned x unsigned multiplications can also be performed without changing the multiplication mode. Each input operand is implicitly treated as an unsigned number if the Working register being used to specify the operand is either W4 or W6. Similarly, an operand is treated as a signed number if the register used is either W5 or W7. The DSP engine selects the type of multiplication to be performed based on the operand registers used, thereby eliminating the need for the user software to modify the US<1:0> bits.

The execution time reductions provided by the implicit mixed-sign multiplication feature is illustrated in the following code example, where the instruction cycle count for performing a 32-bit multiplication is reduced from seven cycles to four cycles when the Mixed-Sign Multiplication mode is enabled.

Example 4-25: 32-Bit Signed Multiplication Using Implicit Mixed-Sign Mode

Case A: Mixed-Sign Multiplication Mode Not Enabled

```
MUL.SU  W5, W6, W0 ; Word1 (signed) x Word2 (unsigned)
MUL.US  W4, W7, W2 ; Word0 (unsigned) x Word3 (signed)
CLR     B          ; Clear Accumulator B
ADD     W1, B
ADD     W3, B
SFTAC   B, #15     ; Shift right by 15 bits to align for Q31 format
MAC     W5*W7, B   ; Word1 (signed) x Word 3 (signed)
```

Case B: Mixed-Sign Multiplication Mode Enabled

```
MPY     W5*W6, B   ; Word1 (signed) x Word2 (unsigned)
MAC     W4*W7, B   ; Word0 (unsigned) x Word3 (signed)
SFTAC   B, #15     ; Shift right by 15 bits to align for Q31 format
MAC     W5*W7, B   ; Word1 (signed) x Word 3 (signed)
```

Besides DSP instructions, MCU Multiplication (MUL) instructions can also utilize Accumulator A or Accumulator B as a result destination, which enables faster extended precision arithmetic, even when not using DSP multiplication instructions such as MPY or MAC.

Section 5. Instruction Descriptions

HIGHLIGHTS

This section of the manual contains the following major topics:

5.1 Instruction Symbols 96
5.2 Instruction Encoding Field Descriptors Introduction 96
5.3 Instruction Description Example 101
5.4 Instruction Descriptions 102

© 2005-2018 Microchip Technology Inc.

5.1 INSTRUCTION SYMBOLS

All the symbols used in **Section 5.4 "Instruction Descriptions"** are listed in Table 1-2.

5.2 INSTRUCTION ENCODING FIELD DESCRIPTORS INTRODUCTION

All instruction encoding field descriptors used in **Section 5.4 "Instruction Descriptions"** are shown in Table 5-2 through Table 5-15.

Table 5-1: Instruction Encoding Field Descriptors

Field	Description
A(1)	Accumulator selection bit: 0 = ACCA; 1 = ACCB
aa(1)	Accumulator Write-Back mode (see Table 5-13)
B	Byte mode selection bit: 0 = word operation; 1 = byte operation
bbbb	4-bit bit position select: 0000 = LSB; 1111 = MSB
D	Destination address bit: 0 = result stored in WREG; 1 = result stored in file register
dddd	Wd Destination register select: 0000 = W0; 1111 = W15
f ffff ffff ffff	13-bit register file address (0x0000 to 0x1FFF)
fff ffff ffff ffff	15-bit register file word address – implied 0 LSB (0x0000 to 0xFFFE)
ffff ffff ffff ffff	16-bit register file byte address (0x0000 to 0xFFFF)
ggg	Register Offset Addressing mode for Ws Source register (see Table 5-5)
hhh	Register Offset Addressing mode for Wd Destination register (see Table 5-6)
iiii(1)	Prefetch X operation (see Table 5-7)
jjjj(1)	Prefetch Y operation (see Table 5-9)
k	1-bit literal field, constant data or expression
kkkk	4-bit literal field, constant data or expression
kk kkkk	6-bit literal field, constant data or expression
kkkk kkkk	8-bit literal field, constant data or expression
kk kkkk kkkk	10-bit literal field, constant data or expression
kk kkkk kkkk kkkk	14-bit literal field, constant data or expression
kkkk kkkk kkkk kkkk	16-bit literal field, constant data or expression
mm	Multiplier source select with same Working registers (see Table 5-11)
mmm	Multiplier source select with different Working registers (see Table 5-12)
nnnn nnnn nnnn nnn0 nnn nnnn	23-bit program address for CALL and GOTO instructions
nnnn nnnn nnnn nnnn	16-bit program offset field for relative branch/call instructions
ppp	Addressing mode for Ws Source register (see Table 5-2)
qqq	Addressing mode for Wd Destination register (see Table 5-3)
rrrr	Barrel shift count
ssss	Ws Source register select: 0000 = W0; 1111 = W15
tttt	Dividend select, most significant word
vvvv	Dividend select, least significant word
W	Double-Word mode selection bit: 0 = word operation; 1 = double-word operation
wwww	Wb Base register select: 0000 = W0; 1111 = W15
xx(1)	Prefetch X destination (see Table 5-8)
xxxx xxxx xxxx xxxx	16-bit unused field (don't care)
yy(1)	Prefetch Y destination (see Table 5-10)
z	Bit test destination: 0 = C flag bit; 1 = Z flag bit

Note 1: This field is only available in dsPIC30F, dsPIC33F, dsPIC33E and dsPIC33C devices.

5.3 INSTRUCTION DESCRIPTION EXAMPLE

The example description below is for the fictitious instruction, FOO. The following example instruction was created to demonstrate how the table fields (syntax, operands, operation, etc.) are used to describe the instructions presented in **Section 5.4 "Instruction Descriptions"**.

FOO

The Header field summarizes what the instruction does

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
				X	X	X	X

Cells marked with an 'X' indicate the instruction is implemented for that device family.

Syntax: The Syntax field consists of an optional label, the instruction mnemonic, any optional extensions which exist for the instruction and the operands for the instruction. Most instructions support more than one operand variant to support the various addressing modes. In these circumstances, all possible instruction operands are listed beneath each other and are enclosed in braces.

Operands: The Operands field describes the set of values which each of the operands may take. Operands may be accumulator registers, file registers, literal constants (signed or unsigned) or Working registers.

Operation: The Operation field summarizes the operation performed by the instruction.

Status Affected: The Status Affected field describes which bits of the STATUS Register are affected by the instruction. Status bits are listed by bit position in descending order.

Encoding: The Encoding field shows how the instruction is bit encoded. Individual bit fields are explained in the Description field and complete encoding details are provided in Table 5.2.

Description: The Description field describes in detail the operation performed by the instruction. A key for the encoding bits is also provided.

Words: The Words field contains the number of program words that are used to store the instruction in memory.

Cycles: The Cycles field contains the number of instruction cycles that are required to execute the instruction.

Examples: The Examples field contains examples that demonstrate how the instruction operates. "Before" and "After" register snapshots are provided, which allow the user to clearly understand what operation the instruction performs.

5.4 INSTRUCTION DESCRIPTIONS

ADD

Add f to WREG

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax: {label:} ADD{.B} f {,WREG}

Operands: f ∈ [0 ... 8191]

Operation: (f) + (WREG) → destination designated by D

Status Affected: DC, N, OV, Z, C

Encoding:

1011	0100	0BDf	ffff	ffff	ffff

Description: Add the contents of the default Working register WREG to the contents of the file register and place the result in the destination register. The optional WREG operand determines the destination register. If WREG is specified, the result is stored in WREG. If WREG is not specified, the result is stored in the file register.

The 'B' bit selects byte or word operation ('0' for word, '1' for byte).
The 'D' bit selects the destination ('0' for WREG, '1' for file register).
The 'f' bits select the address of the file register.

Note 1: The extension .B in the instruction denotes a byte operation rather than a word operation. You may use a .W extension to denote a word operation, but it is not required.

2: The WREG is set to Working register, W0.

Words: 1

Cycles: 1(1)

Note 1: In dsPIC33E, dsPIC33C and PIC24E devices, the listed cycle count does not apply to read and Read-Modify-Write operations on non-CPU Special Function Registers. For more details, see **Note 3** in **Section 3.2.1 "Multicycle Instructions"**.

Example 1:

```
ADD.B    RAM100      ; Add WREG to RAM100 (Byte mode)
```

	Before Instruction		After Instruction	
WREG	CC80	WREG	CC80	
RAM100	FFC0	RAM100	FF40	
SR	0000	SR	0005	(OV, C = 1)

Example 2:

```
ADD      RAM200, WREG   ; Add RAM200 to WREG (Word mode)
```

	Before Instruction		After Instruction	
WREG	CC80	WREG	CC40	
RAM200	FFC0	RAM200	FFC0	
SR	0000	SR	0001	(C = 1)

© 2005-2018 Microchip Technology Inc.

ADD

Add Literal to Wn

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax: {label:} ADD{.B} #lit10, Wn

Operands: lit10 ∈ [0 ... 255] for byte operation
lit10 ∈ [0 ... 1023] for word operation
Wn ∈ [W0 ... W15]

Operation: lit10 + (Wn) → Wn

Status Affected: DC, N, OV, Z, C

Encoding:

1011	0000	0Bkk	kkkk	kkkk	dddd

Description: Add the 10-bit unsigned literal operand to the contents of the Working register Wn and place the result back into the Working register Wn.

The 'B' bit selects byte or word operation ('0' for word, '1' for byte).
The 'k' bits specify the literal operand.
The 'd' bits select the address of the Working register.

Note 1: The extension `.B` in the instruction denotes a byte operation rather than a word operation. You may use a `.W` extension to denote a word operation, but it is not required.

2: For byte operations, the literal must be specified as an unsigned value [0:255]. See **Section 4.6 "Using 10-Bit Literal Operands"** for information on using 10-bit literal operands in Byte mode.

Words: 1

Cycles: 1

Example 1:

```
ADD.B       #0xFF, W7       ; Add -1 to W7 (Byte mode)
```

	Before Instruction		After Instruction	
W7	12C0	W7	12BF	
SR	0000	SR	0009	(N, C = 1)

Example 2:

```
ADD         #0xFF, W1       ; Add 255 to W1 (Word mode)
```

	Before Instruction		After Instruction	
W1	12C0	W1	13BF	
SR	0000	SR	0000	

ADD

Add Wb to Short Literal

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax: {label:} ADD{.B} Wb, #lit5, Wd
[Wd]
[Wd++]
[Wd--]
[++Wd]
[--Wd]

Operands: Wb ∈ [W0 ... W15]
lit5 ∈ [0 ... 31]
Wd ∈ [W0 ... W15]

Operation: (Wb) + lit5 → Wd

Status Affected: DC, N, OV, Z, C

Encoding:

0100	0www	wBqq	qddd	d11k	kkkk

Description: Add the contents of the base register Wb to the 5-bit unsigned short literal operand and place the result in the destination register Wd. Register Direct Addressing must be used for Wb. Either Register Direct or Indirect Addressing may be used for Wd.

The 'w' bits select the address of the base register.
The 'B' bit selects byte or word operation ('0' for word, '1' for byte).
The 'q' bits select the destination addressing mode.
The 'd' bits select the destination register.
The 'k' bits provide the literal operand, a five-bit integer number.

Note: The extension `.B` in the instruction denotes a byte operation rather than a word operation. You may use a `.W` extension to denote a word operation, but it is not required.

Words: 1

Cycles: 1

Example 1:

```
ADD.B      W0, #0x1F, W7      ; Add W0 and 31 (Byte mode)
                              ; Store the result in W7
```

	Before Instruction		After Instruction	
W0	2290	W0	2290	
W7	12C0	W7	12AF	
SR	0000	SR	0008	(N = 1)

Example 2:

```
ADD        W3, #0x6, [--W4]   ; Add W3 and 6 (Word mode)
                              ; Store the result in [--W4]
```

	Before Instruction		After Instruction
W3	6006	W3	6006
W4	1000	W4	0FFE
Data 0FFE	DDEE	Data 0FFE	600C
Data 1000	DDEE	Data 1000	DDEE
SR	0000	SR	0000

ADD

Add Wb to Ws

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax:

{label:}	ADD{.B}	Wb,	Ws,	Wd
			[Ws],	[Wd]
			[Ws++],	[Wd++]
			[Ws--],	[Wd--]
			[++Ws],	[++Wd]
			[--Ws],	[--Wd]

Operands:

Wb ∈ [W0 ... W15]
Ws ∈ [W0 ... W15]
Wd ∈ [W0 ... W15]

Operation: (Wb) + (Ws) → Wd

Status Affected: DC, N, OV, Z, C

Encoding:

0100	0www	wBqq	qddd	dppp	ssss

Description:

Add the contents of the source register Ws and the contents of the base register Wb, and place the result in the destination register Wd. Register Direct Addressing must be used for Wb. Either Register Direct or Indirect Addressing may be used for Ws and Wd.

The 'w' bits select the address of the base register.
The 'B' bit selects byte or word operation ('0' for word, '1' for byte).
The 'q' bits select the destination addressing mode.
The 'd' bits select the destination register.
The 'p' bits select the source addressing mode.
The 's' bits select the source register.

Note: The extension `.B` in the instruction denotes a byte operation rather than a word operation. You may use a `.W` extension to denote a word operation, but it is not required.

Words: 1

Cycles: 1(1)

Note 1: In dsPIC33E, dsPIC33C and PIC24E devices, the listed cycle count does not apply to read and Read-Modify-Write operations on non-CPU Special Function Registers. For more details, see **Note 3** in **Section 3.2.1 "Multicycle Instructions"**.

Example 1:

```
ADD.B    W5, W6, W7      ; Add W5 to W6, store result in W7
                         ; (Byte mode)
```

	Before Instruction		After Instruction
W5	AB00	W5	AB00
W6	0030	W6	0030
W7	FFFF	W7	FF30
SR	0000	SR	0000

Example 2:

```
ADD     W5, W6, W7      ; Add W5 to W6, store result in W7
                        ; (Word mode)
```

	Before Instruction		After Instruction	
W5	AB00	W5	AB00	
W6	0030	W6	0030	
W7	FFFF	W7	AB30	
SR	0000	SR	0008	(N = 1)

© 2005-2018 Microchip Technology Inc.

ADD

Add Accumulators

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
				X	X	X	X

Syntax: {label:} ADD Acc

Operands: Acc ∈ [A,B]

Operation: If (Acc = A):
(ACCA) + (ACCB) → ACCA
Else:
(ACCA) + (ACCB) → ACCB

Status Affected: OA, OB, OAB, SA, SB, SAB

Encoding:

1100	1011	A000	0000	0000	0000

Description: Add the contents of Accumulator A to the contents of Accumulator B and place the result in the selected accumulator. This instruction performs a 40-bit addition.

The 'A' bit specifies the destination accumulator.

Words: 1

Cycles: 1

Example 1:

```
ADD     A           ; Add ACCB to ACCA
```

	Before Instruction		After Instruction
ACCA	00 0022 3300	ACCA	00 1855 7858
ACCB	00 1833 4558	ACCB	00 1833 4558
SR	0000	SR	0000

Example 2:

```
ADD     B           ; Add ACCA to ACCB
                    ; Assume Super Saturation mode enabled
                    ; (ACCSAT = 1, SATA = 1, SATB = 1)
```

	Before Instruction		After Instruction	
ACCA	00 E111 2222	ACCA	00 E111 2222	
ACCB	00 7654 3210	ACCB	01 5765 5432	
SR	0000	SR	4800	(OB, OAB = 1)

ADD

16-Bit Signed Add to Accumulator

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
				X	X	X	X

Syntax:

{label:}	ADD	Ws,	{#Slit4,}	Acc
		[Ws],		
		[Ws++],		
		[Ws--],		
		[--Ws],		
		[++Ws],		
		[Ws+Wb],		

Operands:

Ws ∈ [W0 ... W15]
Wb ∈ [W0 ... W15]
Slit4 ∈ [-8 ... +7]
Acc ∈ [A,B]

Operation:

$Shift_{Slit4}(Extend(Ws)) + (Acc) \rightarrow Acc$

Status Affected:

OA, OB, OAB, SA, SB, SAB

Encoding:

1100	1001	Awww	wrrr	rggg	ssss

Description:

Add a 16-bit value specified by the source Working register to the most significant word of the selected accumulator. The source operand may specify the direct contents of a Working register or an Effective Address. The value specified is added to the most significant word of the accumulator by sign-extending and zero backfilling the source operand prior to the operation. The value added to the accumulator may also be shifted by a 4-bit signed literal before the addition is made.

The 'A' bit specifies the destination accumulator.
The 'w' bits specify the offset register Wb.
The 'r' bits encode the optional shift.
The 'g' bits select the source addressing mode.
The 's' bits specify the source register Ws.

Note: Positive values of operand Slit4 represent an arithmetic shift right and negative values of operand Slit4 represent an arithmetic shift left. The contents of the source register are not affected by Slit4.

Words: 1

Cycles: 1(1)

Note 1: In dsPIC33E, dsPIC33C and PIC24E devices, the listed cycle count does not apply to read and Read-Modify-Write operations on non-CPU Special Function Registers. For more details, see **Note 3** in **Section 3.2.1 "Multicycle Instructions"**.

Example 1:

```
ADD  W0, #2, A        ; Add W0 right-shifted by 2 to ACCA
```

	Before Instruction
W0	8000
ACCA	00 7000 0000
SR	0000

	After Instruction
W0	8000
ACCA	00 5000 0000

ADDC

Add f to WREG with Carry

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax: {label:} ADDC{.B} f {,WREG}

Operands: f ∈ [0 ... 8191]

Operation: (f) + (WREG) + (C) → destination designated by D

Status Affected: DC, N, OV, Z, C

Encoding:

1011	0100	1BDf	ffff	ffff	ffff

Description: Add the contents of the default Working register WREG, the contents of the file register and the Carry bit, and place the result in the destination register. The optional WREG operand determines the destination register. If WREG is specified, the result is stored in WREG. If WREG is not specified, the result is stored in the file register.

The 'B' bit selects byte or word operation ('0' for word, '1' for byte).
The 'D' bit selects the destination ('0' for WREG, '1' for file register).
The 'f' bits select the address of the file register.

Note 1: The extension .B in the instruction denotes a byte operation rather than a word operation. You may use a .W extension to denote a word operation, but it is not required.

2: The WREG is set to Working register W0.

3: The Z flag is "sticky" for ADDC, CPB, SUBB and SUBBR. These instructions can only clear Z.

Words: 1

Cycles: 1(1)

Note 1: In dsPIC33E, dsPIC33C and PIC24E devices, the listed cycle count does not apply to read and Read-Modify-Write operations on non-CPU Special Function Registers. For more details, see **Note 3** in **Section 3.2.1 "Multicycle Instructions"**.

Example 1:

```
ADDC.B    RAM100        ; Add WREG and C bit to RAM100
                        ; (Byte mode)
```

	Before Instruction		After Instruction	
WREG	CC60		WREG	CC60
RAM100	8006		RAM100	8067
SR	0001	(C = 1)	SR	0000

Example 2:

```
ADDC      RAM200, WREG  ; Add RAM200 and C bit to the WREG
                        ; (Word mode)
```

	Before Instruction		After Instruction	
WREG	5600		WREG	8A01
RAM200	3400		RAM200	3400
SR	0001	(C = 1)	SR	000C	(N, OV = 1)

© 2005-2018 Microchip Technology Inc.

ADDC

Add Literal to Wn with Carry

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax: {label:} ADDC{.B} #lit10, Wn

Operands: lit10 ∈ [0 ... 255] for byte operation
lit10 ∈ [0 ... 1023] for word operation
Wn ∈ [W0 ... W15]

Operation: lit10 + (Wn) + (C) → Wn

Status Affected: DC, N, OV, Z, C

Encoding:

1011	0000	1Bkk	kkkk	kkkk	dddd

Description: Add the 10-bit unsigned literal operand, the contents of the Working register Wn and the Carry bit, and place the result back into the Working register Wn.

The 'B' bit selects byte or word operation ('0' for word, '1' for byte).
The 'k' bits specify the literal operand.
The 'd' bits select the address of the Working register.

Note 1: The extension .B in the instruction denotes a byte operation rather than a word operation. You may use a .W extension to denote a word operation, but it is not required.

2: For byte operations, the literal must be specified as an unsigned value [0:255]. See **Section 4.6 "Using 10-Bit Literal Operands"** for information on using 10-bit literal operands in Byte mode.

3: The Z flag is "sticky" for ADDC, CPB, SUBB and SUBBR. These instructions can only clear Z.

Words: 1

Cycles: 1

Example 1:

```
ADDC.B      #0xFF, W7      ; Add -1 and C bit to W7 (Byte mode)
```

	Before Instruction		After Instruction	
W7	12C0		12BF	
SR	0000	(C = 0)	0009	(N, C = 1)

Example 2:

```
ADDC        #0xFF, W1      ; Add 255 and C bit to W1 (Word mode)
```

	Before Instruction		After Instruction	
W1	12C0		13C0	
SR	0001	(C = 1)	0000	

ADDC

Add Wb to Short Literal with Carry

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax:

{label:}	ADDC{.B}	Wb,	#lit5,	Wd
				[Wd]
				[Wd++]
				[Wd--]
				[++Wd]
				[--Wd]

Operands:

Wb ∈ [W0 ... W15]
lit5 ∈ [0 ... 31]
Wd ∈ [W0 ... W15]

Operation: (Wb) + lit5 + (C) → Wd

Status Affected: DC, N, OV, Z, C

Encoding:

0100	1www	wBqq	qddd	d11k	kkkk

Description:

Add the contents of the base register Wb, the 5-bit unsigned short literal operand and the Carry bit, and place the result in the destination register Wd. Register Direct Addressing must be used for Wb. Register Direct or Indirect Addressing may be used for Wd.

The 'w' bits select the address of the base register.
The 'B' bit selects byte or word operation ('0' for word, '1' for byte).
The 'q' bits select the destination addressing mode.
The 'd' bits select the destination register.
The 'k' bits provide the literal operand, a five-bit integer number.

Note 1: The extension .B in the instruction denotes a byte operation rather than a word operation. You may use a .W extension to denote a word operation, but it is not required.

2: The Z flag is "sticky" for ADDC, CPB, SUBB and SUBBR. These instructions can only clear Z.

Words: 1

Cycles: 1

Example 1:

```
ADDC.B     W0, #0x1F, [W7]   ; Add W0, 31 and C bit (Byte mode)
                             ; Store the result in [W7]
```

ADDC

Add Wb to Ws with Carry

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax:

{label:}	ADDC{.B}	Wb,	Ws,	Wd
			[Ws],	[Wd]
			[Ws++],	[Wd++]
			[Ws--],	[Wd--]
			[++Ws],	[++Wd]
			[--Ws],	[--Wd]

Operands:

Wb ∈ [W0 ... W15]
Ws ∈ [W0 ... W15]
Wd ∈ [W0 ... W15]

Operation: (Wb) + (Ws) + (C) → Wd

Status Affected: DC, N, OV, Z, C

Encoding:

0100	1www	wBqq	qddd	dppp	ssss

Description:

Add the contents of the source register Ws, the contents of the base register Wb and the Carry bit, and place the result in the destination register Wd. Register Direct Addressing must be used for Wb. Either Register Direct or Indirect Addressing may be used for Ws and Wd.

The 'w' bits select the address of the base register.
The 'B' bit selects byte or word operation ('0' for word, '1' for byte).
The 'q' bits select the destination addressing mode.
The 'd' bits select the destination register.
The 'p' bits select the source addressing mode.
The 's' bits select the source register.

Note 1: The extension .B in the instruction denotes a byte operation rather than a word operation. You may use a .W extension to denote a word operation, but it is not required.

2: The Z flag is "sticky" for ADDC, CPB, SUBB and SUBBR. These instructions can only clear Z.

Words: 1

Cycles: 1(1)

Note 1: In dsPIC33E, dsPIC33C and PIC24E devices, the listed cycle count does not apply to read and Read-Modify-Write operations on non-CPU Special Function Registers. For more details, see **Note 3** in **Section 3.2.1 "Multicycle Instructions"**.

AND

AND f and WREG

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax: {label:} AND{.B} f {,WREG}

Operands: f ∈ [0 ... 8191]

Operation: (f).AND.(WREG) → destination designated by D

Status Affected: N, Z

Encoding:

1011	0110	0BDf	ffff	ffff	ffff

Description: Compute the logical AND operation of the contents of the default Working register WREG and the contents of the file register, and place the result in the destination register. The optional WREG operand determines the destination register. If WREG is specified, the result is stored in WREG. If WREG is not specified, the result is stored in the file register.

The 'B' bit selects byte or word operation ('0' for word, '1' for byte).
The 'D' bit selects the destination register ('0' for WREG, '1' for file register).
The 'f' bits select the address of the file register.

Note 1: The extension .B in the instruction denotes a byte operation rather than a word operation. You may use a .W extension to denote a word operation, but it is not required.

2: The WREG is set to Working register W0.

Words: 1

Cycles: 1(1)

Note 1: In dsPIC33E, dsPIC33C and PIC24E devices, the listed cycle count does not apply to read and Read-Modify-Write operations on non-CPU Special Function Registers. For more details, see **Note 3** in **Section 3.2.1 "Multicycle Instructions"**.

Example 1:

```
AND.B  RAM100          ; AND WREG to RAM100 (Byte mode)
```

	Before Instruction	After Instruction	
WREG	CC80	CC80	
RAM100	FFC0	FF80	
SR	0000	0008	(N = 1)

Example 2:

```
AND    RAM200, WREG    ; AND RAM200 to WREG (Word mode)
```

	Before Instruction	After Instruction
WREG	CC80	0080
RAM200	12C0	12C0
SR	0000	0000

© 2005-2018 Microchip Technology Inc.

AND

AND Literal and Wn

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax: {label:} AND{.B} #lit10, Wn

Operands: lit10 ∈ [0 ... 255] for byte operation
lit10 ∈ [0 ... 1023] for word operation
Wn ∈ [W0 ... W15]

Operation: lit10.AND.(Wn) → Wn

Status Affected: N, Z

Encoding:

1011	0010	0Bkk	kkkk	kkkk	dddd

Description: Compute the logical AND operation of the 10-bit literal operand and the contents of the Working register Wn, and place the result back into the Working register Wn. Register Direct Addressing must be used for Wn.

The 'B' bit selects byte or word operation ('0' for word, '1' for byte).
The 'k' bits specify the literal operand.
The 'd' bits select the address of the Working register.

Note 1: The extension .B in the instruction denotes a byte operation rather than a word operation. You may use a .W extension to denote a word operation, but it is not required.

2: For byte operations, the literal must be specified as an unsigned value [0:255]. See **Section 4.6 "Using 10-Bit Literal Operands"** for information on using 10-bit literal operands in Byte mode.

Words: 1

Cycles: 1

Example 1:

```
AND.B  #0x83, W7          ; AND 0x83 to W7 (Byte mode)
```

	Before Instruction		After Instruction	
W7	12C0	W7	1280	
SR	0000	SR	0008	(N = 1)

Example 2:

```
AND  #0x333, W1           ; AND 0x333 to W1 (Word mode)
```

	Before Instruction		After Instruction	
W1	12D0	W1	0210

AND

AND Wb and Short Literal

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax: {label:} AND{.B} Wb, #lit5, Wd
[Wd]
[Wd++]
[Wd--]
[++Wd]
[--Wd]

Operands: Wb ∈ [W0 ... W15]
lit5 ∈ [0 ... 31]
Wd ∈ [W0 ... W15]

Operation: (Wb).AND.lit5 → Wd

Status Affected: N, Z

Encoding:

0110	0www	wBqq	qddd	d11k	kkkk

Description: Compute the logical AND operation of the contents of the base register Wb and the 5-bit literal, and place the result in the destination register Wd. Register Direct Addressing must be used for Wb. Either Register Direct or Indirect Addressing may be used for Wd.

The 'w' bits select the address of the base register.
The 'B' bit selects byte or word operation ('0' for word, '1' for byte).
The 'q' bits select the destination addressing mode.
The 'd' bits select the destination register.
The 'k' bits provide the literal operand, a five-bit integer number.

Note: The extension `.B` in the instruction denotes a byte operation rather than a word operation. You may use a `.W` extension to denote a word operation, but it is not required.

Words: 1

Cycles: 1

Example 1:

```
AND.B    W0,#0x3,[W1++]   ; AND W0 and 0x3 (Byte mode)
                          ; Store to [W1]

Arithmetic Shift Right f

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax: {label:} ASR{.B} f {,WREG}

Operands: f ∈ [0 ... 8191]

Operation:

For Byte Operation:
(f<7>) → Dest<7>
(f<7>) → Dest<6>
(f<6:1>) → Dest<5:0>
(f<0>) → C

For Word Operation:
(f<15>) → Dest<15>
(f<15>) → Dest<14>
(f<14:1>) → Dest<13:0>
(f<0>) → C

Status Affected: N, Z, C

Encoding:

1101	0101	1BDf	ffff	ffff	ffff

Description: Shift the contents of the file register one bit to the right and place the result in the destination register. The Least Significant bit of the file register is shifted into the Carry bit of the STATUS Register. After the shift is performed, the result is sign-extended. The optional WREG operand determines the destination register. If WREG is specified, the result is stored in WREG. If WREG is not specified, the result is stored in the file register.

The 'B' bit selects byte or word operation ('0' for word, '1' for byte).
The 'D' bit selects the destination register ('0' for WREG, '1' for file register).
The 'f' bits select the address of the file register.

Note 1: The extension `.B` in the instruction denotes a byte operation rather than a word operation. You may use a `.W` extension to denote a word operation, but it is not required.

2: The WREG is set to Working register W0.

Words: 1

Cycles: 1(1)

Note 1: In dsPIC33E, dsPIC33C and PIC24E devices, the listed cycle count does not apply to read and Read-Modify-Write operations on non-CPU Special Function Registers. For more details, see **Note 3** in **Section 3.2.1 "Multicycle Instructions"**.

Example 1:

Arithmetic Shift Right by Wns

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax: {label:} ASR Wb, Wns, Wnd

Operands:
Wb ∈ [W0 ... W15]
Wns ∈ [W0 ...W15]
Wnd ∈ [W0 ... W15]

Operation:
Wns<3:0> → Shift_Val
Wb<15> → Wnd<15:15-Shift_Val + 1>
Wb<15:Shift_Val> → Wnd<15-Shift_Val:0>

Status Affected: N, Z

Encoding:

1101	1110	1www	wddd	d000	ssss

Description:
Arithmetic shift right the contents of the source register Wb by the 4 Least Significant bits of Wns (up to 15 positions) and store the result in the destination register Wnd. After the shift is performed, the result is sign-extended. Direct Addressing must be used for Wb, Wns and Wnd.

The 'w' bits select the address of the base register.
The 'd' bits select the destination register.
The 's' bits select the source register.

Note 1: This instruction operates in Word mode only.

2: If Wns is greater than 15, Wnd = 0x0 if Wb is positive and Wnd = 0xFFFF if Wb is negative.

BCLR

Bit Clear in f

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax: {label:} BCLR{.B} f, #bit4

Operands:
f ∈ [0 ... 8191] for byte operation
f ∈ [0 ... 8190] (even only) for word operation
bit4 ∈ [0 ... 7] for byte operation
bit4 ∈ [0 ... 15] for byte operation

Operation: 0 → f<bit4>

Status Affected: None

Encoding:

1010	1001	bbbf	ffff	ffff	fffb

Description: Clear the bit in the file register f specified by 'bit4'. Bit numbering begins with the Least Significant bit (bit 0) and advances to the Most Significant bit (bit 7 for byte operations, bit 15 for word operations).

The 'b' bits select value bit 4 of the bit position to be cleared.
The 'f' bits select the address of the file register.

Note 1: The extension `.B` in the instruction denotes a byte operation rather than a word operation. You may use a `.W` extension to denote a word operation, but it is not required.

2: When this instruction operates in Word mode, the file register address must be word-aligned.

3: When this instruction operates in Byte mode, 'bit4' must be between 0 and 7.

Words: 1

Cycles: 1(1)

Note 1: In dsPIC33E, dsPIC33C and PIC24E devices, the listed cycle count does not apply to read and Read-Modify-Write operations on non-CPU Special Function Registers. For more details, see **Note 3** in **Section 3.2.1 "Multicycle Instructions"**.

1010	0001	bbbb	0B00	0ppp	ssss

Description:
Clear the bit in register Ws specified by 'bit4'. Bit numbering begins with the Least Significant bit (bit 0) and advances to the Most Significant bit (bit 7 for byte operations, bit 15 for word operations). Register Direct or Indirect Addressing may be used for Ws.

The 'b' bits select value bit4 of the bit position to be cleared.
The 'B' bit selects byte or word operation ('0' for word, '1' for byte).
The 's' bits select the source/destination register.
The 'p' bits select the source addressing mode.

Note 1: The extension `.B` in the instruction denotes a byte operation rather than a word operation. You may use a `.W` extension to denote a word operation, but it is not required.

2: When this instruction operates in Word mode, the source register address must be word-aligned.

3: When this instruction operates in Byte mode, 'bit4' must be between 0 and 7.

4: In dsPIC33E, dsPIC33C and PIC24E devices, this instruction uses the DSRPAG register for Indirect Addressing generation in Extended Data Space (EDS).

Words:
1

Cycles:
1(1)

Note 1: In dsPIC33E, dsPIC33C and PIC24E devices, the listed cycle count does not apply to read and Read-Modify-Write operations on non-CPU Special Function Registers. For more details, see **Note 3** in **Section 3.2.1 "Multicycle Instructions"**.

BFEXT

Bit Field Extract from Ws into Wnd

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
							X

Syntax:

{label:}	BFEXT	#bit4,	#wid5,	Ws,	Wnd
				[Ws],	
				[Ws++],	
				[Ws--],	
				[++Ws],	
				[--Ws],	

Operands: bit4 ∈ [0 ... 15]; wid5 ∈ [1 ... 16];
Ws ∈ [W0 ... W15]; Wnd ∈ [W0 ... W15]

Operation: See text

Status Affected: None

Encoding:

1st word	0000	1010	1000	wwww	MMMM	LLLL
2nd word	0000	0000	0000	0000	0ppp	ssss

Description: A bit field is extracted (copied) from (Ws) and written into Wnd. The bit field data loaded into Wnd starts at Wnd<0>, and all MSbs within Wnd that are beyond the defined bit field width, will be cleared.

The bit location within Ws of the LSb of the bit field to be extracted is defined by operand bit4. The width of the bit field may be up to 16 bits and is defined by operand wid5.

The 'w' bits select the address of the bit field destination register.
The 's' bits select the address of the data source register.
The 'p' bits select the source addressing mode.
The 'LLLL' bits define the bit field LSb position within the target word.
The 'MMMM' bits define the bit field MSb position within the target word.

BFEXT

Bit Field Extract from f into Wnd

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
							X

Syntax: {label:} BFEXT #bit4, #wid5, f, Wnd

Operands: bit4 ∈ [0 ... 15]; wid5 ∈ [1 ... 16];
Wnd ∈ [W0 ... W15]; f ∈ [0 ... 65534]

Operation: See text

Status Affected: None

Encoding:

1st word	0000	1010	1010	wwww	MMMM	LLLL
2nd word	0000	0000	ffff	ffff	ffff	fff0

Description: A bit field is extracted (copied) from the file register address and written into Wnd. The bit field data loaded into Wnd starts at Wnd<0> and all MSbs within Wnd, that are beyond the defined bit field width, will be cleared.

The bit location within Ws of the LSb of the bit field to be extracted is defined by operand bit4. The width of the bit field may be up to 16 bits and is defined by operand wid5.

The ‘w’ bits select the address of the bit field destination register.
The ‘f’ bits select the (word) address of the source file register.
The ‘LLLL’ bits define the bit field LSb position within the target word.
The ‘MMMM’ bits define the bit field MSb position within the target word.

Words: 2

Cycles: 2

BFINS

Bit Field Insert from Wb into Wd

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
							X

Syntax:

{label:}	BFINS	#bit4	#wid5,	Wns,	Wd
					[Wd]
					[Wd++]
					[Wd--]
					[++Wd]
					[--Wd]

Operands: bit4 ∈ [0 ... 15]; wid5 ∈ [1 ... 16];
Wns ∈ [W0 ... W15]; Wd ∈ [W0 ... W15]

Operation: See text

Status Affected: None

Encoding:

1st word	0000	1010	0000	wwww	MMMM	LLLL
2nd word	0000	0000	0000	0000	0ppp	dddd

Description: A bit field is read from (Wb) and inserted (copied) into Wd. The bit field data sourced from Wns starts at Wns<0>. All MSbs within Wns, that are beyond the defined bit field width, are ignored and may be set to any value.

The bit location within Wd of the LSb of the bit field to be inserted is defined by operand bit4. The width of the bit field may be up to 16 bits and is defined by operand wid5. The insert operation overwrites the existing bits within the insert range (i.e., it does not shift the existing bits to accommodate the inserted bits).

The 'w' bits select the address of the bit field source register.
The 'd' bits select the address of the data destination register.
The 'p' bits select Source Addressing Mode 1.
The 'LLLL' bits define the bit field LSb position within the target word.
The 'MMMM' bits define the bit field MSb position within the target word.

BFINS

Bit Field Insert Literal into Ws

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
							X

Syntax:

{label:}	BFINS	#bit4,	#wid5,	#lit8,	Ws
					[Ws]
					[Ws++]
					[Ws--]
					[++Ws]
					[--Ws]

Operands: bit4 ∈ [0 ... 15]; wid5 ∈ [1 ... 16];
lit8∈ [0 ... 255]; Ws ∈ [W0 ... W15]

Operation: See text

Status Affected: None

Encoding:

1st word	0000	1010	0100	0000	MMMM	LLLL
2nd word	0000	0000	kkkk	kkkk	0ppp	ssss

Description: A bit field literal value is inserted (copied) into Ws. The bit field data sourced from the literal starts at the LSb of the literal. All MSbs within the literal value, that are beyond the defined bit field width, are ignored and may be set to any value.

The bit location within Ws of the LSb of the bit field to be inserted is defined by operand bit4. The width of the bit field may be up to 16 bits and is defined by operand wid5.

The 'k' bits contain the bit field source value.
The 's' bits select the address of the source/destination register.
The 'p' bits select Source Addressing Mode 1.
The 'LLLL' bits define the bit field LSb position within the target word.
The 'MMMM' bits define the bit field MSb position within the target word.

BOOTSWP(1)

Swap Active and Inactive Flash Address Panel

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X					X	X

Syntax: {label:} BOOTSWP

Operands: None

Operation: If
(Dual Boot Operating mode and the BOOTSWP instruction are enabled
(via device-specific Configuration bits))
Then
(P2ACTIV (NVMCON<10>) → $\overline{\text{P2ACTIV}}$
1 → SFTSWP (NVMCON<11>))
Else
Execute as NOP

Status Affected: None

Encoding:

1111	1110	0010	0000	0000	0000

Description: If the BOOTSWP instruction is enabled (via device-specific Configuration bit) and the device is operating in a Dual Boot mode, and the NVMKEY software interlock sequence has been satisfied, the BOOTSWP instruction will:

1. Toggle the state of the P2ACTIV (NVMCON<10>) status bit, which will swap the Active and Inactive Flash address space within the program space address map.
2. Set SFTSWP (NVMCON<11>), indicating a successful panel swap.

Words: 1

Cycles: 2

Note 1: This instruction is present only in some devices of the device families listed above. Please see the specific device data sheet to ensure that this instruction is supported on a specific device.

BRA

Branch Unconditionally

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax: {label:} BRA Expr

Operands: Expr may be a label, absolute address or expression.
Expr is resolved by the linker to a Slit16, where Slit16 ∈ [-32768 ... +32767].

Operation: (PC + 2) + 2 * Slit16 → PC
NOP → Instruction Register

Status Affected: None

Encoding:

0011	0111	nnnn	nnnn	nnnn	nnnn

Description: The program will branch unconditionally, relative to the next PC. The offset of the branch is the two's complement number, '2 * Slit16', which supports branches of up to 32K instructions, forward or backward. The Slit16 value is resolved by the linker from the supplied label, absolute address or expression. After the branch is taken, the new address will be (PC + 2) + 2 * Slit16, since the PC will have incremented to fetch the next instruction.

The 'n' bits are a signed literal that specifies the number of program words offset from (PC + 2).

Words: 1

Cycles: 2 (PIC24F, PIC24H, dsPIC30F, dsPIC33F)

4 (PIC24E, dsPIC33E, dsPIC33C)

BRA C

Branch if Carry

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax: {label:} BRA C, Expr

Operands: Expr may be a label, absolute address or expression.
Expr is resolved by the linker to a Slit16, where Slit16 ∈ [-32768 ... +32767].

Operation: Condition = C
If (Condition)
(PC + 2) + 2 * Slit16 → PC
NOP → Instruction Register

Status Affected: None

Encoding:

0011	0001	nnnn	nnnn	nnnn	nnnn

Description: If the Carry flag bit is '1', then the program will branch relative to the next PC. The offset of the branch is the two's complement number, '2 * Slit16', which supports branches up to 32K instructions, forward or backward. The Slit16 value is resolved by the linker from the supplied label, absolute address or expression.

If the branch is taken, the new address will be (PC + 2) + 2 * Slit16, since the PC will have incremented to fetch the next instruction. The instruction then becomes a two-cycle instruction, with a NOP executed in the second cycle.

The 'n' bits are a 16-bit signed literal that specify the offset from (PC + 2) in instruction words.

Words: 1

Cycles: 1 (2 if branch taken) – PIC24F, PIC24H, dsPIC30F, dsPIC33F

1 (4 if branch taken) – PIC24E, dsPIC33E, dsPIC33C

Example 1:

```
002000 HERE:     BRA C, CARRY    ; If C is set, branch to CARRY
002002 NO_C:     . . .           ; Otherwise... continue

BRA GE

Branch if Signed Greater Than or Equal

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax: {label:} BRA GE, Expr

Operands: Expr may be a label, absolute address or expression.
Expr is resolved by the linker to a Slit16, where
Slit16 ∈ [-32768 ... +32767].

Operation: Condition = (N&&OV)||(!N&&!OV)
If (Condition)
(PC + 2) + 2 * Slit16 → PC
NOP → Instruction Register

Status Affected: None

Encoding:

0011	1101	nnnn	nnnn	nnnn	nnnn

Description: If the logical expression, (N&&OV)||(!N&&!OV), is true, then the program will branch relative to the next PC. The offset of the branch is the two's complement number, '2 * Slit16', which supports branches up to 32K instructions, forward or backward. The Slit16 value is resolved by the linker from the supplied label, absolute address or expression.

If the branch is taken, the new address will be (PC + 2) + 2 * Slit16, since the PC will have incremented to fetch the next instruction. The instruction then becomes a two-cycle instruction, with a NOP executed in the second cycle.

The 'n' bits are a 16-bit signed literal that specify the offset from (PC + 2) in instruction words.

Note: The assembler will convert the specified label into the offset to be used.

Words: 1

Cycles: 1 (2 if branch taken) – PIC24F, PIC24H, dsPIC30F, dsPIC33F

1 (4 if branch taken) – PIC24E, dsPIC33E, dsPIC33C

Example 1:

```
007600 LOOP:    . . .
007602          . . .
007604          . . .
007606          . . .
007608 HERE:    BRA GE, LOOP          ; If GE, branch to LOOP
00760A NO_GE:   . . .                 ; Otherwise... continue
```

	Before Instruction		After Instruction
PC	00 7608	PC	00 7600

BRA GEU

Branch if Unsigned Greater Than or Equal

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax: {label:} BRA GEU, Expr

Operands: Expr may be a label, absolute address or expression.
Expr is resolved by the linker to a Slit16 offset that supports an offset range of [-32768 ... +32767] program words.

Operation: Condition = C
If (Condition)
(PC + 2) + 2 * Slit16 → PC
NOP → Instruction Register

Status Affected: None

Encoding:

0011	0001	nnnn	nnnn	nnnn	nnnn

Description: If the Carry flag is '1', then the program will branch relative to the next PC. The offset of the branch is the two's complement number, '2 * Slit16', which supports branches up to 32K instructions, forward or backward. The Slit16 value is resolved by the linker from the supplied label, absolute address or expression.

If the branch is taken, the new address will be (PC + 2) + 2 * Slit16, since the PC will have incremented to fetch the next instruction. The instruction then becomes a two-cycle instruction, with a NOP executed in the second cycle.

The 'n' bits are a 16-bit signed literal that specify the offset from (PC + 2) in instruction words.

Note: This instruction is identical to the BRA C, Expr (Branch if Carry) instruction and has the same encoding. It will reverse assemble as BRA C, Slit16.

Words: 1

Cycles: 1 (2 if branch taken) – PIC24F, PIC24H, dsPIC30F, dsPIC33F

1 (4 if branch taken) – PIC24E, dsPIC33E, dsPIC33C

Example 1:

```

BRA GT

Branch if Signed Greater Than

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax: {label:} BRA GT, Expr

Operands: Expr may be a label, absolute address or expression.
Expr is resolved by the linker to a Slit16, where
Slit16 ∈ [-32768 ... +32767].

Operation: Condition = (!Z&&N&&OV)||(!Z&&!N&&!OV)
If (Condition)
(PC + 2) + 2 * Slit16 → PC
NOP → Instruction Register

Status Affected: None

Encoding:

0011	1100	nnnn	nnnn	nnnn	nnnn

Description: If the logical expression, (!Z&&N&&OV)||(!Z&&!N&&!OV), is true, then the program will branch relative to the next PC. The offset of the branch is the two's complement number, '2 * Slit16', which supports branches up to 32K instructions, forward or backward. The Slit16 value is resolved by the linker from the supplied label, absolute address or expression.

If the branch is taken, the new address will be (PC + 2) + 2 * Slit16, since the PC will have incremented to fetch the next instruction. The instruction then becomes a two-cycle instruction, with a NOP executed in the second cycle.

The 'n' bits are a 16-bit signed literal that specify the offset from (PC + 2) in instruction words.

Words: 1

Cycles: 1 (2 if branch taken) – PIC24F, PIC24H, dsPIC30F, dsPIC33F

1 (4 if branch taken) – PIC24E, dsPIC33E, dsPIC33C

Example 1:

```
002000 HERE:     BRA GT, BYPASS         ; If GT, branch to BYPASS
002002 NO_GT:    . . .                  ; Otherwise... continue
002004           . . .
002006           . . .
002008           . . .
00200A           GOTO THERE
00200C BYPASS:   . . .

BRA LTU

Branch if Unsigned Less Than

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax: {label:} BRA LTU, Expr

Operands: Expr may be a label, absolute address or expression.
Expr is resolved by the linker to a Slit16, where
Slit16 ∈ [-32768 ... +32767].

Operation: Condition = !C
If (Condition)
(PC + 2) + 2 * Slit16 → PC
NOP → Instruction Register

Status Affected: None

Encoding:

0011	1001	nnnn	nnnn	nnnn	nnnn

Description: If the Carry flag is '0', then the program will branch relative to the next PC. The offset of the branch is the two's complement number, '2 * Slit16', which supports branches up to 32K instructions, forward or backward. The Slit16 value is resolved by the linker from the supplied label, absolute address or expression.

If the branch is taken, the new address will be (PC + 2) + 2 * Slit16, since the PC will have incremented to fetch the next instruction. The instruction then becomes a two-cycle instruction, with a NOP executed in the second cycle.

The 'n' bits are a signed literal that specifies the number of instructions offset from (PC + 2).

Note : This instruction is identical to the BRA NC, Expr (Branch if Not Carry) instruction and has the same encoding. It will reverse assemble as BRA NC, Slit16.

Words: 1

Cycles: 1 (2 if branch taken) – PIC24F, PIC24H, dsPIC30F, dsPIC33F

1 (4 if branch taken) – PIC24E, dsPIC33E, dsPIC33C

Example 1:

BRA OA

Branch if Overflow Accumulator A

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
				X	X	X	X

Syntax: {label:} BRA OA, Expr

Operands: Expr may be a label, absolute address or expression.
Expr is resolved by the linker to a Slit16, where
Slit16 ∈ [-32768 ... +32767].

Operation: Condition = OA
If (Condition)
(PC + 2) + 2 * Slit16 → PC
NOP → Instruction Register

Status Affected: None

Encoding:

0000	1100	nnnn	nnnn	nnnn	nnnn

Description: If the Overflow Accumulator A flag is '1', then the program will branch relative to the next PC. The offset of the branch is the two's complement number, '2 * Slit16', which supports branches up to 32K instructions, forward or backward. The Slit16 value is resolved by the linker from the supplied label, absolute address or expression.

If the branch is taken, the new address will be (PC + 2) + 2 * Slit16, since the PC will have incremented to fetch the next instruction. The instruction then becomes a two-cycle instruction, with a NOP executed in the second cycle.

The 'n' bits are a signed literal that specifies the number of instructions offset from (PC + 2).

Note: The assembler will convert the specified label into the offset to be used.

Words: 1

Cycles: 1 (2 if branch taken) – dsPIC30F, dsPIC33F

1 (4 if branch taken) – dsPIC33E, dsPIC33C

Example 1:

```
002000 HERE:     BRA OA, BYPASS        ; If OA, branch to BYPASS
002002 NO_OA:    . . .                 ; Otherwise... continue

BSET

Bit Set in f

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax: {label:} BSET{.B} f, #bit4

Operands:
f ∈ [0 ... 8191] for byte operation
f ∈ [0 ... 8190] (even only) for word operation
bit4 ∈ [0 ... 7] for byte operation
bit4 ∈ [0 ... 15] for word operation

Operation: 1 → f<bit4>

Status Affected: None

Encoding:

1010	1000	bbbf	ffff	ffff	fffb

Description: Set the bit in the file register 'f' specified by 'bit4'. Bit numbering begins with the Least Significant bit (bit 0) and advances to the Most Significant bit (bit 7 for byte operations, bit 15 for word operations).

The 'b' bits select value bit4 of the bit position to be set.
The 'f' bits select the address of the file register.

Note 1: The extension `.B` in the instruction denotes a byte operation rather than a word operation. You may use a `.W` extension to denote a word operation, but it is not required.

2: When this instruction operates in Word mode, the file register address must be word-aligned.

3: When this instruction operates in Byte mode, 'bit4' must be between 0 and 7.

Words: 1

Cycles: 1(1)

Note 1: In dsPIC33E, dsPIC33C and PIC24E devices, the listed cycle count does not apply to read and Read-Modify-Write operations on non-CPU Special Function Registers. For more details, see **Note 3** in **Section 3.2.1 "Multicycle Instructions"**.

Example 1:

BSET

Bit Set in Ws

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax: {label:} BSET{.B} Ws, #bit4
[Ws],
[Ws++],
[Ws--],
[++Ws],
[--Ws],

Operands: Ws ∈ [W0 ... W15]
bit4 ∈ [0 ... 7] for byte operation
bit4 ∈ [0 ... 15] for word operation

Operation: 1 → Ws<bit4>

Status Affected: None

Encoding:

1010	0000	bbbb	0B00	0ppp	ssss

Description: Set the bit in register Ws specified by 'bit4'. Bit numbering begins with the Least Significant bit (bit 0) and advances to the Most Significant bit (bit 7 for byte operations, bit 15 for word operations). Register Direct or Indirect Addressing may be used for Ws.

The 'b' bits select value bit4 of the bit position to be cleared.
The 'B' bit selects byte or word operation ('0' for word, '1' for byte).
The 'p' bits select the source addressing mode.
The 's' bits select the source/destination register.

Note 1: The extension `.B` in the instruction denotes a byte operation rather than a word operation. You may use a `.W` extension to denote a word operation, but it is not required.

2: When this instruction operates in Word mode, the source register address must be word-aligned.

3: When this instruction operates in Byte mode, 'bit4' must be between 0 and 7.

4: In dsPIC33E, dsPIC33C and PIC24E devices, this instruction uses the DSRPAG register for indirect address generation in Extended Data Space.

Words: 1

Cycles: 1(1)

Note 1: In dsPIC33E, dsPIC33C and PIC24E devices, the listed cycle count does not apply to read and Read-Modify-Write operations on non-CPU Special Function Registers. For more details, see **Note 3** in **Section 3.2.1 "Multicycle Instructions"**.

BSW

Bit Write in Ws

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax: {label:} BSW.C Ws, Wb
BSW.Z [Ws],
[Ws++],
[Ws--],
[++Ws],
[--Ws],

Operands: Ws ∈ [W0 ... W15]
Wb ∈ [W0 ... W15]

Operation: For ".C" Operation:
C → Ws<(Wb)>
For ".Z" Operation (default):
$\overline{Z}$ → Ws<(Wb)>

Status Affected: None

Encoding:

1010	1101	Zwww	w000	0ppp	ssss

Description: The (Wb) bit in register Ws is written with the value of the C or $\overline{Z}$ flag from the STATUS Register. Bit numbering begins with the Least Significant bit (bit 0) and advances to the Most Significant bit (bit 15) of the Working register. Only the four Least Significant bits of Wb are used to determine the destination bit number. Register Direct Addressing must be used for Wb, and either Register Direct or Indirect Addressing may be used for Ws.

The 'Z' bit selects the C or Z flag as source.
The 'w' bits select the address of the bit select register.
The 'p' bits select the source addressing mode.
The 's' bits select the source register.

Note: This instruction only operates in Word mode. If no extension is provided, the ".Z" operation is assumed.

Words: 1

Cycles: 1(1)

Note 1: In dsPIC33E, dsPIC33C and PIC24E devices, the listed cycle count does not apply to read and Read-Modify-Write operations on non-CPU Special Function Registers. For more details, see **Note 3** in **Section 3.2.1 "Multicycle Instructions"**.

BTG

Bit Toggle in f

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax: {label:} BTG{.B} f, #bit4

Operands:
f ∈ [0 ... 8191] for byte operation
f ∈ [0 ... 8190] (even only) for word operation
bit4 ∈ [0 ... 7] for byte operation
bit4 ∈ [0 ... 15] for word operation

Operation: $\overline{(f)<bit4>} \rightarrow (f)<bit4>$

Status Affected: None

Encoding:

1010	1010	bbbf	ffff	ffff	fffb

Description:
Bit 'bit4' in file register 'f' is toggled (complemented). For the bit4 operand, bit numbering begins with the Least Significant bit (bit 0) and advances to the Most Significant bit (bit 7 for byte operation, bit 15 for word operation) of the byte.

The 'b' bits select value bit4, the bit position to toggle.
The 'f' bits select the address of the file register.

Note 1: The extension `.B` in the instruction denotes a byte operation rather than a word operation. You may use a `.W` extension to denote a word operation, but it is not required.

2: When this instruction operates in Word mode, the file register address must be word-aligned.

3: When this instruction operates in Byte mode, 'bit4' must be between 0 and 7.

Description: Bit 'bit4' in register Ws is toggled (complemented). For the bit4 operand, bit numbering begins with the Least Significant bit (bit 0) and advances to the Most Significant bit (bit 7 for byte operations, bit 15 for word operations). Register Direct or Indirect Addressing may be used for Ws.

The 'b' bits select value bit4, the bit position to test.
The 'B' bit selects byte or word operation ('0' for word, '1' for byte).
The 's' bits select the source/destination register.
The 'p' bits select the source addressing mode.

Note 1: The extension `.B` in the instruction denotes a byte operation rather than a word operation. You may use a `.W` extension to denote a word operation, but it is not required.

2: When this instruction operates in Word mode, the source register address must be word-aligned.

3: When this instruction operates in Byte mode, 'bit4' must be between 0 and 7.

4: In dsPIC33E, dsPIC33C and PIC24E devices, this instruction uses the DSRPAG register for indirect address generation in Extended Data Space.

Words: 1

Cycles: 1(1)

Note 1: In dsPIC33E, dsPIC33C and PIC24E devices, the listed cycle count does not apply to read and Read-Modify-Write operations on non-CPU Special Function Registers. For more details, see **Note 3** in **Section 3.2.1 "Multicycle Instructions"**.

BTSC

Bit Test f, Skip if Clear

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax: {label:} BTSC{.B} f, #bit4

Operands:
f ∈ [0 ... 8191] for byte operation
f ∈ [0 ... 8190] (even only) for word operation
bit4 ∈ [0 ... 7] for byte operation
bit4 ∈ [0 ... 15] for word operation

Operation: Test (f)<bit4>, skip if clear

Status Affected: None

Encoding:

1010	1111	bbbf	ffff	ffff	fffb

Description: Bit 'bit4' in the file register is tested. If the tested bit is '0', the next instruction (fetched during the current instruction execution) is discarded and on the next cycle, a NOP is executed instead. If the tested bit is '1', the next instruction is executed as normal. In either case, the contents of the file register are not changed. For the bit4 operand, bit numbering begins with the Least Significant bit (bit 0) and advances to the Most Significant bit (bit 7 for byte operations, bit 15 for word operations).

The 'b' bits select value bit4, the bit position to test.
The 'f' bits select the address of the file register.

Note 1: The extension .B in the instruction denotes a byte operation rather than a word operation. You may use a .W extension to denote a word operation, but it is not required.

2: When this instruction operates in Word mode, the file register address must be word-aligned.

3: When this instruction operates in Byte mode, 'bit4' must be between 0 and 7.

Words: 1

Cycles: 1 (2 or 3)[(1)]

Note 1: In dsPIC33E, dsPIC33C and PIC24E devices, the listed cycle count does not apply to read and Read-Modify-Write operations on non-CPU Special Function Registers. For more details, see **Note 3** in **Section 3.2.1 "Multicycle Instructions"**.

BTSS

Bit Test f, Skip if Set

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax: {label:} BTSS{.B} f, #bit4

Operands:
f ∈ [0 ... 8191] for byte operation
f ∈ [0 ... 8190] (even only) for word operation
bit4 ∈ [0 ... 7] for byte operation
bit4 ∈ [0 ... 15] for word operation

Operation: Test (f)<bit4>, skip if set

Status Affected: None

Encoding:

1010	1110	bbbf	ffff	ffff	fffb

Description: Bit 'bit4' in file register 'f' is tested. If the tested bit is '1', the next instruction (fetched during the current instruction execution) is discarded and on the next cycle, a NOP is executed instead. If the tested bit is '0', the next instruction is executed as normal. In either case, the contents of the file register are not changed. For the bit4 operand, bit numbering begins with the Least Significant bit (bit 0) and advances to the Most Significant bit (bit 7 for byte operation, bit 15 for word operation).

The 'b' bits select value bit4, the bit position to test.
The 'f' bits select the address of the file register.

Note 1: The extension .B in the instruction denotes a byte operation rather than a word operation. You may use a .W extension to denote a word operation, but it is not required.
2: When this instruction operates in Word mode, the file register address must be word-aligned.
3: When this instruction operates in Byte mode, 'bit4' must be between 0 and 7.

BTST

Bit Test in f

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax: {label:} BTST{.B} f, #bit4

Operands:
f ∈ [0 ... 8191] for byte operation
f ∈ [0 ... 8190] (even only) for word operation
bit4 ∈ [0 ... 7] for byte operation
bit4 ∈ [0 ... 15] for word operation

Operation: $\overline{(f)<bit4>} \rightarrow Z$

Status Affected: Z

Encoding:

1010	1011	bbbf	ffff	ffff	fffb

Description: Bit 'bit4' in file register 'f' is tested and the complement of the tested bit is stored to the Z flag in the STATUS Register. The contents of the file register are not changed. For the bit4 operand, bit numbering begins with the Least Significant bit (bit 0) and advances to the Most Significant bit (bit 7 for byte operation, bit 15 for word operation).

The 'b' bits select value bit4, the bit position to be tested.
The 'f' bits select the address of the file register.

Note 1: The extension `.B` in the instruction denotes a byte operation rather than a word operation. You may use a `.W` extension to denote a word operation, but it is not required.

2: When this instruction operates in Word mode, the file register address must be word-aligned.

3: When this instruction operates in Byte mode, 'bit4' must be between 0 and 7.

Words: 1

Cycles: 1(1)

Note 1: In dsPIC33E, dsPIC33C and PIC24E devices, the listed cycle count does not apply to read and Read-Modify-Write operations on non-CPU Special Function Registers. For more details, see **Note 3** in **Section 3.2.1 "Multicycle Instructions"**.

Example 1:

```
BTST.B  0x1201, #0x3      ; Set Z = complement of

BTST

Bit Test in Ws

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax:

{label:}	BTST.C	Ws,	#bit4
	BTST.Z	[Ws],	
		[Ws++],	
		[Ws--],	
		[++Ws],	
		[--Ws],	

Operands:
Ws ∈ [W0 ... W15]
bit4 ∈ [0 ... 15]

Operation:
For ".C" Operation:
(Ws)<bit4> → C
For ".Z" Operation (default):
$\overline{(Ws)<bit4>}$ → Z

Status Affected: Z or C

Encoding:

1010	0011	bbbb	Z000	0ppp	ssss

Description:
Bit 'bit4' in register Ws is tested. If the ".Z" option of the instruction is specified, the complement of the tested bit is stored to the Zero flag in the STATUS Register. If the ".C" option of the instruction is specified, the value of the tested bit is stored to the Carry flag in the STATUS Register. In either case, the contents of Ws are not changed.

For the bit4 operand, bit numbering begins with the Least Significant bit (bit 0) and advances to the Most Significant bit (bit 15) of the word. Either Register Direct or Indirect Addressing may be used for Ws.

The 'b' bits select value bit4, the bit position to test.
The 'Z' bit selects the C or Z flag as destination.
The 'p' bits select the source addressing mode.
The 's' bits select the source register.

Note: This instruction only operates in Word mode. If no extension is provided, the ".Z" operation is assumed.

Words: 1

Cycles: 1(1)

Note 1: In dsPIC33E, dsPIC33C and PIC24E devices, the listed cycle count does not apply to read and Read-Modify-Write operations on non-CPU Special Function Registers. For more details, see **Note 3** in **Section 3.2.1 "Multicycle Instructions"**.

BTST

Bit Test in Ws

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax:

{label:}	BTST.C	Ws,	Wb
	BTST.Z	[Ws],	
		[Ws++],	
		[Ws--],	
		[++Ws],	
		[--Ws],	

Operands:

Ws ∈ [W0 ... W15]
Wb ∈ [W0 ... W15]

Operation:

For ".C" Operation:
(Ws)<(Wb)> → C

For ".Z" Operation (default):
$\overline{(Ws)<(Wb)>}$ → Z

Status Affected:

Z or C

Encoding:

1010	0101	Zwww	w000	0ppp	ssss

Description:

The (Wb) bit in register Ws is tested. If the ".C" option of the instruction is specified, the value of the tested bit is stored to the Carry flag in the STATUS Register. If the ".Z" option of the instruction is specified, the complement of the tested bit is stored to the Zero flag in the STATUS Register. In either case, the contents of Ws are not changed.

Only the four Least Significant bits of Wb are used to determine the bit number. Bit numbering begins with the Least Significant bit (bit 0) and advances to the Most Significant bit (bit 15) of the Working register. Register Direct or Indirect Addressing may be used for Ws.

The 'Z' bit selects the C or Z flag as destination.
The 'w' bits select the address of the bit select register.
The 'p' bits select the source addressing mode.
The 's' bits select the source register.

Note: This instruction only operates in Word mode. If no extension is provided, the ".Z" operation is assumed.

Words:

BTSTS

Bit Test/Set in f

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax: {label:} BTSTS{.B} f, #bit4

Operands:
f ∈ [0 ... 8191] for byte operation
f ∈ [0 ... 8190] (even only) for word operation
bit4 ∈ [0 ... 7] for byte operation
bit4 ∈ [0 ... 15] for word operation

Operation:
$\overline{(f)<bit4>} \rightarrow Z$
$1 \rightarrow (f)<bit4>$

Status Affected: Z

Encoding:

1010	1100	bbbf	ffff	ffff	fffb

Description:
Bit 'bit4' in file register 'f' is tested and the complement of the tested bit is stored to the Zero flag in the STATUS Register. The tested bit is then set to '1' in the file register. For the bit4 operand, bit numbering begins with the Least Significant bit (bit 0) and advances to the Most Significant bit (bit 7 for byte operations, bit 15 for word operations).

The 'b' bits select value bit4, the bit position to test/set.
The 'f' bits select the address of the file register.

Note 1: The extension `.B` in the instruction denotes a byte operation rather than a word operation. You may use a `.W` extension to denote a word operation, but it is not required.
2: When this instruction operates in Word mode, the file register address must be word-aligned.
3: When this instruction operates in Byte mode, 'bit4' must be between 0 and 7.
4: The file register 'f' must not be the CPU STATUS Register (SR).

Words: 1

Cycles: 1(1)

Note 1: In dsPIC33E, dsPIC33C and PIC24E devices, the listed cycle count does not apply to read and Read-Modify-Write operations on non-CPU Special Function Registers. For more details, see **Note 3** in **Section 3.2.1 "Multicycle Instructions"**.

Example 1:

```
BTSTS.B  0x1201, #0x3  ; Set Z = complement of bit 3 in 0x1201,
                       ; then set bit 3 of 0x1201 = 1
```

	Before Instruction		After Instruction	
Data 1200	F7FF	Data 1200	FFFF	
SR	0000	SR	0002	(Z = 1)

Example 2:

```
BTSTS    0x808, #15    ; Set Z = complement of bit 15 in 0x808,
                       ; then set bit 15 of 0x808 = 1
```

BTSTS

Bit Test/Set in Ws

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax: {label:} BTSTS.C Ws, #bit4
BTSTS.Z [Ws],
[Ws++],
[Ws--],
[++Ws],
[--Ws],

Operands: Ws ∈ [W0 ... W15]
bit4 ∈ [0 ... 15]

Operation: For ".C" Operation:
(Ws)<bit4> → C
1 → Ws<bit4>
For ".Z" Operation (default):
$\overline{(Ws)<bit4>}$ → Z
1 → Ws<bit4>

Status Affected: Z or C

Encoding:

1010	0100	bbbb	Z000	0ppp	ssss

Description: Bit 'bit4' in register Ws is tested. If the ".Z" option of the instruction is specified, the complement of the tested bit is stored to the Zero flag in the STATUS Register. If the ".C" option of the instruction is specified, the value of the tested bit is stored to the Carry flag in the STATUS Register. In both cases, the tested bit in Ws is set to '1'.

The 'b' bits select the value bit4, the bit position to test/set.
The 'Z' bit selects the C or Z flag as destination.
The 'p' bits select the source addressing mode.
The 's' bits select the source register.

Note 1: This instruction only operates in Word mode. If no extension is provided, the ".Z" operation is assumed.

2: If Ws is used as a pointer, it must not contain the address of the CPU STATUS Register (SR).

3: In dsPIC33E, dsPIC33C and PIC24E devices, this instruction uses the DSRPAG register for indirect address generation in Extended Data Space.

Words: 1

Cycles: 1(1)

Note 1: In dsPIC33E, dsPIC33C and PIC24E devices, the listed cycle count does not apply to read and Read-Modify-Write operations on non-CPU Special Function Registers. For more details, see **Note 3** in **Section 3.2.1 "Multicycle Instructions"**.

CALL

Call Subroutine

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X		X	X		

Syntax: {label:} CALL Expr

Operands: Expr may be a label or expression (but not a literal).
Expr is resolved by the linker to a lit23, where lit23 ∈ [0 ... 8388606].

Operation: (PC) + 4 → PC
(PC<15:0>) → (TOS)
(W15) + 2 → W15
(PC<23:16>) → (TOS)
(W15) + 2 → W15
lit23 → PC
NOP → Instruction Register

Status Affected: None

Encoding:

1st word	0000	0010	nnnn	nnnn	nnnn	nnn0
2nd word	0000	0000	0000	0000	0nnn	nnnn

Description: Direct subroutine call over the entire 4-Mbyte instruction program memory range. Before the CALL is made, the 24-bit return address (PC + 4) is PUSHed onto the stack. After the return address is stacked, the 23-bit value, 'lit23', is loaded into the PC.

The 'n' bits form the target address.

Note: The linker will resolve the specified expression into the lit23 to be used.

Words: 2

Cycles: 2

Example 1:

```
026000          CALL    _FIR              ; Call _FIR subroutine
026004          MOV     W0, W1
   .            ...
   .            ...
026844 _FIR:    MOV     #0x400, W2        ; _FIR subroutine start

CALL.L

Call Indirect Subroutine Long

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
			X			X	X

Syntax: {label:} CALL.L Wn

Operands: Wn ∈ [W0, W2, W4, W6, W8, W10, W12]

Operation:
(PC) + 2 → PC
(PC<15:1>) → TOS<15:1>, SFA Status bit → TOS<0>
(W15) + 2 → W15
(PC<23:16>) → TOS
(W15) + 2 → W15
0 → SFA Status bit
PC<23> → PC<23> (see text); (Wn+1)<6:0> → PC<22:16>; (Wn) → PC<15:0>
NOP → Instruction Register

Status Affected: SFA

Encoding:

0000	0001	1www	w000	0000	ssss

Description:
Indirect subroutine call to any user program memory address. First, the return address (PC+2) and the state of the Stack Frame Active bit (SFA) are pushed onto the system stack, after which, the SFA bit is cleared.

Then, the Least Significant 7 bits of (Wn+1) are loaded in PC<22:16> and the 16-bit value (Wn) is loaded into PC<15:0>.

PC<23> is not modified by this instruction.

The contents of (Wn+1)<15:7> are ignored.
The value of Wn<0> is also ignored and PC<0> is always set to '0'.
The 's' bits specify the address of the Wn source register.
The 'w' bits specify the address of the Wn+1 source register.

Words: 1

Cycles: 4

Example 1:

```

CLR

Clear f or WREG

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax: {label:} CLR{.B} f
WREG

Operands: f ∈ [0 ... 8191]

Operation: 0 → destination designated by D

Status Affected: None

Encoding:

1110	1111	0BDf	ffff	ffff	ffff

Description: Clear the contents of a file register or the default Working register WREG. If WREG is specified, the WREG is cleared. Otherwise, the specified file register 'f' is cleared.

The 'B' bit selects byte or word operation ('0' for word, '1' for byte).
The 'D' bit selects the destination register ('0' for WREG, '1' for file register).
The 'f' bits select the address of the file register.

Note 1: The extension .B in the instruction denotes a byte operation rather than a word operation. You may use a .W extension to denote a word operation, but it is not required.

2: The WREG is set to Working register W0.

Words: 1

Cycles: 1

Example 1:

```

CLR

Clear Wd

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax: {label:} CLR{.B} Wd
[Wd]
[Wd++]
[Wd--]
[++Wd]
[--Wd]

Operands: Wd ∈ [W0 ... W15]

Operation: 0 → Wd

Status Affected: None

Encoding:

1110	1011	0Bqq	qddd	d000	0000

Description: Clear the contents of register Wd. Either Register Direct or Indirect Addressing may be used for Wd.

The 'B' bit select byte or word operation ('0' for word, '1' for byte).
The 'q' bits select the destination addressing mode.
The 'd' bits select the destination register.

Note: The extension .B in the instruction denotes a byte operation rather than a word operation. You may use a .W extension to denote a word operation, but it is not required.

Words: 1

Cycles: 1

Example 1:

```
CLR.B  W2          ; Clear W2 (Byte mode)
```

	Before Instruction	After Instruction

CLR

Clear Accumulator, Prefetch Operands

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
				X	X	X	X

Syntax:

{label:}	CLR	Acc	{,[Wx],Wxd}	{,[Wy],Wyd}	{,AWB}
			{,[Wx] + = kx,Wxd}	{,[Wy] + = ky,Wyd}	
			{,[Wx] – = kx,Wxd}	{,[Wy] – = ky,Wyd}	
			{,[W9 + W12],Wxd}	{,[W11 + W12],Wyd}	

Operands:

Acc ∈ [A,B]
Wx ∈ [W8, W9]; kx ∈ [-6, -4, -2, 2, 4, 6]; Wxd ∈ [W4 ... W7]
Wy ∈ [W10, W11]; ky ∈ [-6, -4, -2, 2, 4, 6]; Wyd ∈ [W4 ... W7]
AWB ∈ [W13, [W13] + = 2]

Operation:

0 → Acc(A or B)
([Wx]) → Wxd; (Wx) +/– kx → Wx
([Wy]) → Wyd; (Wy) +/– ky → Wy
(Acc(B or A)) rounded → AWB

Status Affected: OA, OB, SA, SB

Encoding:

1100	0011	A0xx	yyii	iijj	jjaa

Description:

Clear all 40 bits of the specified accumulator. Optionally prefetch operands in preparation for a MAC type instruction and optionally store the non-specified accumulator results. This instruction clears the respective overflow and saturate flags (either OA, SA or OB, SB).

Operands, Wx, Wxd, Wy and Wyd, specify optional prefetch operations, which support Indirect and Register Offset Addressing, as described in **Section 4.15.1 "MAC Prefetches"**. Operand AWB specifies the optional register direct or indirect store of the convergently rounded contents of the "other" accumulator, as described in **Section 4.15.4 "MAC Write-Back"**.

The 'A' bit selects the other accumulator used for Write-Back.
The 'x' bits select the prefetch Wxd destination.
The 'y' bits select the prefetch Wyd destination.
The 'i' bits select the Wx prefetch operation.
The 'j' bits select the Wy prefetch operation.
The 'a' bits select the accumulator Write-Back destination.

Words: 1

Cycles: 1

© 2005-2018 Microchip Technology Inc.

Example 1:

```
CLR  A, [W8]+=2, W4, W13  ; Clear ACCA
                          ; Load W4 with [W8], post-inc W8

CLRWDT

Clear Watchdog Timer

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax: {label:} CLRWDT

Operands: None

Operation: 0 → WDT Count register
0 → WDT Prescaler A count
0 → WDT Prescaler B count

Status Affected: None

Encoding:

1111	1110	0110	0000	0000	0000

Description: Clear the contents of the Watchdog Timer Count register and the Prescaler Count registers. The Watchdog Prescaler A and Prescaler B settings, set by Configuration fuses in the FWDT, are not changed.

Words: 1

Cycles: 1

Example 1:

```
CLRWDT     ; Clear Watchdog Timer
```

COM

Complement f

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax: {label:} COM{.B} f {,WREG}

Operands: f ∈ [0 ... 8191]

Operation: $\overline{(f)} \rightarrow$ destination designated by D

Status Affected: N, Z

Encoding:

1110	1110	1BDf	ffff	ffff	ffff

Description: Compute the 1's complement of the contents of the file register and place the result in the destination register. The optional WREG operand determines the destination register. If WREG is specified, the result is stored in WREG. If WREG is not specified, the result is stored in the file register.

The 'B' bit selects byte or word operation ('0' for word, '1' for byte).
The 'D' bit selects the destination register ('0' for WREG, '1' for file register).
The 'f' bits select the address of the file register.

Note 1: The extension .B in the instruction denotes a byte operation rather than a word operation. You may use a .W extension to denote a word operation, but it is not required.

2: The WREG is set to Working register W0.

Words: 1

Cycles: 1[(1)]

Note 1: In dsPIC33E, dsPIC33C and PIC24E devices, the listed cycle count does not apply to read and Read-Modify-Write operations on non-CPU Special Function Registers. For more details, see **Note 3** in **Section 3.2.1 "Multicycle Instructions"**.

Example 1:

```
COM.b  RAM200          ; COM RAM200 (Byte mode)
```

	Before Instruction		After Instruction	
RAM200	80FF	RAM200	8000	
SR	0000	SR	0002	(Z)

Example 2:

```
COM    RAM400, WREG    ; COM RAM400 and store to WREG
                       ; (Word mode)
```

COM

Complement Ws

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax:	{label:}	COM{.B}	Ws,	Wd
			[Ws],	[Wd]
			[Ws++],	[Wd++]
			[Ws--],	[Wd--]
			[++Ws],	[++Wd]
			[--Ws],	[--Wd]

Operands: Ws ∈ [W0 ... W15]
Wd ∈ [W0 ... W15]

Operation: $\overline{(Ws)} \rightarrow Wd$

Status Affected: N, Z

Encoding:

1110	1010	1Bqq	qddd	dppp	ssss

Description: Compute the 1's complement of the contents of the source register Ws and place the result in the destination register Wd. Either Register Direct or Indirect Addressing may be used for both Ws and Wd.

The 'B' bit selects byte or word operation ('0' for word, '1' for byte).
The 'q' bits select the destination addressing mode.
The 'd' bits select the destination register.
The 'p' bits select the source addressing mode.
The 's' bits select the source register.

Note: The extension `.B` in the instruction denotes a byte operation rather than a word operation. You may use a `.W` extension to denote a word operation, but it is not required.

Words: 1

Cycles: 1(1)

Note 1: In dsPIC33E, dsPIC33C and PIC24E devices, the listed cycle count does not apply to read and Read-Modify-Write operations on non-CPU Special Function Registers. For more details, see **Note 3** in **Section 3.2.1 "Multicycle Instructions"**.

Example 1:

```
COM.B  [W0++], [W1++]      ; COM [W0] and store to [W1] (Byte mode)
                           ; Post-increment W0, W1

CP

Compare f with WREG, Set Status Flags

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax: {label:} CP{.B} f

Operands: f ∈ [0 ...8191]

Operation: (f) – (WREG)

Status Affected: DC, N, OV, Z, C

Encoding:

1110	0011	0B0f	ffff	ffff	ffff

Description: Compute (f) – (WREG) and update the STATUS Register. This instruction is equivalent to the SUBWF instruction, but the result of the subtraction is not stored.

The 'B' bit selects byte or word operation ('0' for word, '1' for byte).
The 'f' bits select the address of the file register.

Note 1: The extension .B in the instruction denotes a byte operation rather than a word operation. You may use a .W extension to denote a word operation, but it is not required.

2: The WREG is set to Working register W0.

Words: 1

Cycles: 1(1)

Note 1: In dsPIC33E, dsPIC33C and PIC24E devices, the listed cycle count does not apply to read and Read-Modify-Write operations on non-CPU Special Function Registers. For more details, see **Note 3** in **Section 3.2.1 "Multicycle Instructions"**.

CP

Compare Wb with lit5, Set Status Flags

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X		X	X		

Syntax: {label:} CP{.B} Wb, #lit5

Operands: Wb ∈ [W0 ... W15]
lit5 ∈ [0 ... 31]

Operation: (Wb) – lit5

Status Affected: DC, N, OV, Z, C

Encoding:

1110	0001	0www	wB00	011k	kkkk

Description: Compute (Wb) – lit5 and update the STATUS Register. This instruction is equivalent to the SUB instruction, but the result of the subtraction is not stored. Register Direct Addressing must be used for Wb.

The 'w' bits select the address of the Wb Base register.
The 'B' bit selects byte or word operation ('0' for word, '1' for byte).
The 'k' bits provide the literal operand, a five-bit integer number.

Note: The extension .B in the instruction denotes a byte operation rather than a word operation. You may use a .W extension to denote a word operation, but it is not required.

Words: 1

Cycles: 1

CPB

Compare Ws with Wb Using Borrow, Set Status Flags

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax: {label:} CPB{.B} Wb, Ws
[Ws]
[Ws++]
[Ws--]
[++Ws]
[--Ws]

Operands: Wb ∈ [W0 ... W15]
Ws ∈ [W0 ... W15]

Operation: (Wb) – (Ws) – ($\overline{C}$)

Status Affected: DC, N, OV, Z, C

Encoding:

1110	0001	1www	wB00	0ppp	ssss

Description: Compute (Wb) – (Ws) – ($\overline{C}$) and update the STATUS Register. This instruction is equivalent to the SUBB instruction, but the result of the subtraction is not stored. Register Direct Addressing must be used for Wb. Register Direct or Indirect Addressing may be used for Ws.

The 'w' bits select the address of the Wb source register.
The 'B' bit selects byte or word operation ('0' for word, '1' for byte).
The 'p' bits select the source addressing mode.
The 's' bits select the address of the Ws source register.

Note 1: The extension .B in the instruction denotes a byte operation rather than a word operation. You may use a .W extension to denote a word operation, but it is not required.

2: The Z flag is "sticky" for ADDC, CPB, SUBB and SUBBR. These instructions can only clear Z.

Words: 1

Cycles: 1(1)

Note 1: In dsPIC33E, dsPIC33C and PIC24E devices, the listed cycle count does not apply to read and Read-Modify-Write operations on non-CPU Special Function Registers. For more details, see **Note 3** in **Section 3.2.1 "Multicycle Instructions"**.

Example 1:

```
CPB.B  W0, [W1++]  ; Compare [W1] with W0 using C (Byte mode)
                   ; Post-increment W1
```

	Before Instruction		After Instruction	
W0	ABA9		W0	ABA9
W1	1000		W1	1001
Data 1000	D0A9		Data 1000	D0A9
SR	0002	(Z = 1)	SR	0008 (N = 1)

Example 2:
```
CPB.B  W0, [W1++]  ; Compare [W1] with W0 using C (Byte mode)
                   ; Post-increment W1
```

	Before Instruction		After Instruction	
W0	ABA9		ABA9	
W1	1000		1001	
Data 1000	D0A9		D0A9	
SR	0001	(C = 1)	0001	(C = 1)

Example 3:
```
CPB     W4, W5     ; Compare W5 with W4 using C (Word mode)
```

	Before Instruction		After Instruction	
W4	4000		4000	
W5	3000		3000	
SR	0001	(C = 1)	0001	(C = 1)

CPBEQ

Compare Wb with Wn, Branch if Equal (Wb = Wn)

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
			X			X	X

Syntax: {label:} CPBEQ{.B} Wb, Wn, Expr

Operands: Wb ∈ [W0 ... W15]
Wn ∈ [W0 ... W15]

Operation: (Wb) – (Wn)
If (Wb) = (Wn), [(PC+2) + 2 * Expr] → PC and NOP → Instruction Register

Status Affected: None

Encoding:

1110	0111	1www	wBnn	nnnn	ssss

Description: Compare the contents of Wb with the contents of Wn by performing the subtraction, (Wb) – (Wn), but do not store the result. If (Wb) = (Wn), the next instruction (fetched during the current instruction execution) is discarded, the PC is recalculated based on the 6-bit signed offset specified by Expr, and on the next cycle, a NOP is executed instead. If (Wb) ≠ (Wn), the next instruction is executed as normal (branch is not taken).

The 'w' bits select the address of the Wb source register.
The 'B' bit selects byte or word operation ('0' for word, '1' for byte).
The 's' bits select the address of the Wn source register.
The 'n' bits select the offset of the branch destination.

Note: The extension .B in the instruction denotes a byte operation rather than a word operation. You may use a .W extension to denote a word operation, but it is not required.

Words: 1

Cycles: 1 (5 if branch taken)

Example 1:

```
002000 HERE:   CPBEQ.B W0, W1, BYPASS     ; If W0 = W1 (Byte mode)
002002 ADD     W2, W3, W4                 ; Perform branch to BYPASS
002004         ...
002006         ...
002008 BYPASS: ...
00200A         ...
```

CPSLT

Signed Compare Wb with Wn, Skip if Less Than (Wb < Wn)

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
			X			X	X

Syntax: {label:} CPSLT{.B} Wb, Wn

Operands: Wb ∈ [W0 ... W15]
Wn ∈ [W0 ... W15]

Operation: (Wb) – (Wn)
Skip if (Wb) < (Wn)

Status Affected: None

Encoding:

1110	0110	1www	wB00	0001	ssss

Description: Compare the contents of Wb with the contents of Wn by performing the subtraction, (Wb) – (Wn), but do not store the result. If (Wb) < (Wn), the next instruction (fetched during the current instruction execution) is discarded, and on the next cycle, a NOP is executed instead. Otherwise, the next instruction is executed as normal.

The 'w' bits select the address of the Wb source register.
The 'B' bit selects byte or word operation ('0' for word, '1' for byte).
The 's' bits select the address of the Wn source register.

Note: The extension .B in the instruction denotes a byte operation rather than a word operation. You may use a .W extension to denote a word operation, but it is not required.

Words: 1

Cycles: 1 (2 or 3 if skip taken)

Example 1:

```
002000 HERE:   CPSLT.B    W8, W9      ; If W8 < W9 (Byte mode),
002002         GOTO       BYPASS      ; skip the GOTO
002006         ...

CTXTSWP(1)

CPU Register Context Swap Literal

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
						X	X

Syntax: {label:} CTXTSWP #lit3

Operands: lit3 ∈ [0 ... 4]

Operation: If context defined by lit3 is valid,
Then
Switch CPU register context to context defined by lit3
Else
Execute as 2-cycle NOP

Status Affected: None

Encoding:

1111	1110	1110	0000	0000	0kkk

Description: This instruction will force a CPU register context switch (W0 through W14, and Accumulators A and B) from the current context to the target context defined by the value defined by #lit3. If the specified context is not implemented on the device, this instruction will execute as a 2-cycle NOP.

A successful context switch will update the current context identifier and the manual context identifier (held in CCTXI<2:0> (CTXTSTAT<10:8>) and MCTXI<2:0> (CTXTSTAT<2:0>), respectively) to reflect the new active CPU register context.

Words: 1

Cycles: 2

Note 1: This instruction is present only in some devices of the device families. Please see the specific device data sheet to ensure that this instruction is supported on a specific device.

© 2005-2018 Microchip Technology Inc.

CTXTSWP(1)

CPU Register Context Swap Wn

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
						X	X

Syntax: {label:} CTXTSWP Wn

Operands: Wn ∈ [W0 ... W15]

Operation: If context defined by the contents of Wn<2:0> is valid,
Then
Switch CPU register context to context defined by the contents of Wn<2:0>
Else
Execute as 2-cycle NOP

Status Affected: None

Encoding:

1111	1110	1111	0000	0000	ssss

Description: This instruction will force a CPU register context switch (W0 through W14, and Accumulators A and B) from the current context to the target context defined by the value in the three Least Significant bits of Wn. If the specified context is not implemented on the device, this instruction will execute as a 2-cycle NOP.

A successful context switch will update the current context identifier and the manual context identifier (held in CCTXI<2:0> (CTXTSTAT<10:8>) and MCTXI<2:0> (CTXTSTAT<2:0>), respectively) to reflect the new active CPU register context.

Words: 1

Cycles: 2

Note 1: This instruction is present only in some devices of the device families. Please see the specific device data sheet to ensure that this instruction is supported on a specific device.

DAW.B

Decimal Adjust Wn

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax: {label:} DAW.B Wn

Operands: Wn ∈ [W0 ... W15]

Operation:
If (Wn<3:0> > 9) or (DC = 1)
  (Wn<3:0>) + 6 → Wn<3:0>
Else
  (Wn<3:0>) → Wn<3:0>
If (Wn<7:4> > 9) or (C = 1)
  (Wn<7:4>) + 6 → Wn<7:4>
Else
  (Wn<7:4>) → Wn<7:4>

Status Affected: C

Encoding:

1111	1101	0100	0000	0000	ssss

Description: Adjust the Least Significant Byte in Wn to produce a Binary Coded Decimal (BCD) result. The Most Significant Byte of Wn is not changed and the Carry flag is used to indicate any decimal rollover. Register Direct Addressing must be used for Wn.

The 's' bits select the source/destination register.

Note 1: This instruction is used to correct the data format after two packed BCD bytes have been added.

2: This instruction operates in Byte mode only and the .B extension must be included with the opcode.

Words: 1

Cycles: 1

Example 1:

```
DAW.B  W0       ; Decimal adjust W0
```

	Before Instruction		After Instruction	
W0	771A		7720

DEC

Decrement f

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax: {label:} DEC{.B} f {,WREG}

Operands: f ∈ [0 ... 8191]

Operation: (f) – 1 → destination designated by D

Status Affected: DC, N, OV, Z, C

Encoding:

1110	1101	0BDf	ffff	ffff	ffff

Description: Subtract one from the contents of the file register and place the result in the destination register. The optional WREG operand determines the destination register. If WREG is specified, the result is stored in WREG. If WREG is not specified, the result is stored in the file register.

The 'B' bit selects byte or word operation ('0' for word, '1' for byte).
The 'D' bit selects the destination register ('0' for WREG, '1' for file register).
The 'f' bits select the address of the file register.

Note 1: The extension `.B` in the instruction denotes a byte operation rather than a word operation. You may use a `.W` extension to denote a word operation, but it is not required.

2: The WREG is set to Working register W0.

Words: 1

Cycles: 1(1)

Note 1: In dsPIC33E, dsPIC33C and PIC24E devices, the listed cycle count does not apply to read and Read-Modify-Write operations on non-CPU Special Function Registers. For more details, see **Note 3** in **Section 3.2.1 "Multicycle Instructions"**.

DEC

Decrement Ws

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax: {label:} DEC{.B} Ws, Wd
[Ws], [Wd]
[Ws++], [Wd++]
[Ws--], [Wd--]
[++Ws], [++Wd]
[--Ws], [--Wd]

Operands: Ws ∈ [W0 ... W15]
Wd ∈ [W0 ... W15]

Operation: (Ws) – 1 → Wd

Status Affected: DC, N, OV, Z, C

Encoding:

1110	1001	0Bqq	qddd	dppp	ssss

Description: Subtract one from the contents of the source register Ws and place the result in the destination register Wd. Either Register Direct or Indirect Addressing may be used by Ws and Wd.

The 'B' bit selects byte or word operation ('0' for word, '1' for byte).
The 'q' bits select the destination addressing mode.
The 'd' bits select the destination register.
The 'p' bits select the source addressing mode.
The 's' bits select the source register.

Note: The extension `.B` in the instruction denotes a byte operation rather than a word operation. You may use a `.W` extension to denote a word operation, but it is not required.

Words: 1

Cycles: 1(1)

Note 1: In dsPIC33E, dsPIC33C and PIC24E devices, the listed cycle count does not apply to read and Read-Modify-Write operations on non-CPU Special Function Registers. For more details, see **Note 3** in **Section 3.2.1 "Multicycle Instructions"**.

DISI

Disable Interrupts Temporarily

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax: {label:} DISI #lit14

Operands: lit14 ∈ [0 ... 16383]

Operation: lit14 → DISICNT
1 → DISI
Disable interrupts for (lit14 + 1) cycles

Status Affected: None

Encoding:

1111	1100	00kk	kkkk	kkkk	kkkk

Description: Disable interrupts of Priority 0 through Priority 6 for (lit14 + 1) instruction cycles. Priority 0 through Priority 6 interrupts are disabled, starting in the cycle that `DISI` executes, and remain disabled for the next (lit 14) cycles. The lit14 value is written to the DISICNT register and the `DISI` flag (INTCON2<14>) is set to '1'. This instruction can be used before executing time-critical code to limit the effects of interrupts.

Note 1: This instruction does not prevent Priority 7 interrupts and traps from running. See the specific device family reference manual for details.

2: This instruction does not prevent any interrupts when the device is in Sleep mode.

Words: 1

Cycles: 1

Example 1:

```
002000 HERE:   DISI    #100    ; Disable interrupts for 101 cycles
002002                         ; next 100 cycles protected by DISI
002004         ...
```

DIV.S

Signed Integer Divide

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax: {label:} DIV.S{W} Wm, Wn

DIV.SD Wm, Wn

Operands: Wm ∈ [W0 ... W15] for word operation
Wm ∈ [W0, W2, W4 ... W14] for double operation
Wn ∈ [W2 ... W15]

Operation:

For Word Operation (default):
Wm → W0
If (Wm<15> = 1):
0xFFFF → W1
Else:
0x0 → W1
W1:W0/Wn → W0
Remainder → W1

For Double Operation (DIV.SD):
Wm + 1:Wm → W1:W0
W1:W0/Wn → W0
Remainder → W1

Status Affected: N, OV, Z, C

Encoding:

1101	1000	0ttt	tvvv	vW00	ssss

Description: Iterative, signed integer divide, where the dividend is stored in Wm (for a 16-bit by 16-bit divide) or Wm + 1:Wm (for a 32-bit by 16-bit divide) and the divisor is stored in Wn. In the default word operation, Wm is first copied to W0 and sign-extended through W1 to perform the operation. In the double operation, Wm + 1:Wm is first copied to W1:W0. The 16-bit quotient of the divide operation is stored in W0 and the 16-bit remainder is stored in W1.

This instruction must be executed 18 times using the REPEAT instruction (with an iteration count of 17) to generate the correct quotient and remainder. The N flag will be set if the remainder is negative and cleared otherwise. The OV flag will be set if the divide operation resulted in an overflow and cleared otherwise. The Z flag will be set if the remainder is '0' and cleared otherwise. The C flag is used to implement the divide algorithm and its final value should not be used.

The 't' bits select the most significant word of the dividend for the double operation. These bits are clear for the word operation.
The 'v' bits select the least significant word of the dividend.
The 'W' bit selects the dividend size ('0' for 16-bit, '1' for 32-bit).

Note 1: The 's' bits select the Divisor register. The extension .D in the instruction denotes a double-word (32-bit) dividend rather than a word dividend. You may use a .W extension to denote a word operation, but it is not required.

2: Unexpected results will occur if the quotient can not be represented in 16 bits. When this occurs for the double operation (DIV.SD), the OV Status bit will be set and the quotient and remainder should not be used. For the word operation (DIV.S), only one type of overflow may occur (0x8000/0xFFFF = +32768 or 0x00008000), which allows the OV Status bit to interpret the result.

3: Dividing by zero will initiate an arithmetic error trap during the first cycle of execution.

4: This instruction is interruptible on each instruction cycle boundary.

Words: 1

Cycles: 18 (plus 1 for REPEAT execution) for PIC24F, PIC24H, PIC24E, dsPIC30F, dsPIC33F, dsPIC33E

6 (plus 1 for REPEAT execution) for dsPIC33C

DIV.U

Unsigned Integer Divide

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax: {label:} DIV.U{W} Wm, Wn
DIV.UD Wm, Wn

Operands: Wm ∈ [W0 ... W15] for word operation
Wm ∈ [W0, W2, W4 ... W14] for double operation
Wn ∈ [W2 ... W15]

Operation:
For Word Operation (default):
Wm → W0
0x0 → W1
W1:W0/Wn → W0
Remainder → W1
For Double Operation (DIV.UD):
Wm + 1:Wm → W1:W0
W1:W0/Wns → W0
Remainder → W1

Status Affected: N, OV, Z, C

Encoding:

1101	1000	1ttt	tvvv	vW00	ssss

Description: Iterative, unsigned integer divide, where the dividend is stored in Wm (for a 16-bit by 16-bit divide) or Wm + 1:Wm (for a 32-bit by 16-bit divide) and the divisor is stored in Wn. In the word operation, Wm is first copied to W0 and W1 is cleared to perform the divide. In the double operation, Wm + 1:Wm is first copied to W1:W0. The 16-bit quotient of the divide operation is stored in W0 and the 16-bit remainder is stored in W1.

This instruction must be executed 18 times using the REPEAT instruction (with an iteration count of 17) to generate the correct quotient and remainder. The N flag will always be cleared. The OV flag will be set if the divide operation resulted in an overflow and cleared otherwise. The Z flag will be set if the remainder is '0' and cleared otherwise. The C flag is used to implement the divide algorithm and its final value should not be used.

The 't' bits select the most significant word of the dividend for the double operation. These bits are clear for the word operation.
The 'v' bits select the least significant word of the dividend.
The 'W' bit selects the dividend size ('0' for 16-bit, '1' for 32-bit).
The 's' bits select the Divisor register.

Note 1: The extension .D in the instruction denotes a double-word (32-bit) dividend rather than a word dividend. You may use a .W extension to denote a word operation, but it is not required.

2: Unexpected results will occur if the quotient can not be represented in 16 bits. This may only occur for the double operation (DIV.UD). When an overflow occurs, the OV Status bit will be set, and the quotient and remainder should not be used.

3: Dividing by zero will initiate an arithmetic error trap during the first cycle of execution.

4: This instruction is interruptible on each instruction cycle boundary.

Words: 1

DIVF

Fractional Divide

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
				X	X	X	X

Syntax: {label:} DIVF Wm, Wn

Operands: Wm ∈ [W0 ... W15]
Wn ∈ [W2 ... W15]

Operation: 0x0 → W0
Wm → W1
W1:W0/Wn → W0
Remainder → W1

Status Affected: N, OV, Z, C

Encoding:

1101	1001	0ttt	t000	0000	ssss

Description: Iterative, signed fractional 16-bit by 16-bit divide, where the dividend is stored in Wm and the divisor is stored in Wn. To perform the operation, W0 is first cleared and Wm is copied to W1. The 16-bit quotient of the divide operation is stored in W0 and the 16-bit remainder is stored in W1. The sign of the remainder will be the same as the sign of the dividend.

This instruction must be executed 18 times using the REPEAT instruction (with an iteration count of 17) to generate the correct quotient and remainder. The N flag will be set if the remainder is negative and cleared otherwise. The OV flag will be set if the divide operation resulted in an overflow and cleared otherwise. The Z flag will be set if the remainder is '0' and cleared otherwise. The C flag is used to implement the divide algorithm and its final value should not be used.

The 't' bits select the Dividend register.
The 's' bits select the Divisor register.

Note 1: For the fractional divide to be effective, Wm must be less than Wn. If Wm is greater than or equal to Wn, unexpected results will occur because the fractional result will be greater than or equal to 1.0. When this occurs, the OV Status bit will be set, and the quotient and remainder should not be used.

2: Dividing by zero will initiate an arithmetic error trap during the first cycle of execution.

3: This instruction is interruptible on each instruction cycle boundary.

DIVF2

Signed Fractional Divide, 16/16 (W1:W0 Preserved)

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
							X

Syntax: {label:} DIVF2 Wm, Wn

Operands: Wn ∈ [W2 ... W15]; Wm ∈ [W2 ... W15]

Operation: Wm = Dividend, Wn = Divisor:
0x0000 → W(m–1)
Wm:W(m–1)/Wn → W(m–1); Remainder → Wm

Status Affected: C, N, OV, Z

Encoding:

1101	1001	0ttt	t000	0010	ssss

Description: Iterative, signed fractional 16-bit by 16-bit divide, producing a 16-bit quotient and a 16-bit remainder. The sign of the remainder will be the same as that of the dividend.

This instruction must be executed 6 times to generate the correct quotient and remainder. This may only be achieved by executing a REPEAT with an iteration count of 5 (i.e., 5+1 iterations in all) and the DIVF instruction as its target.

The N flag will be set if the remainder is negative and cleared otherwise. The OV flag will be set if the divide operation resulted in an overflow and cleared otherwise. The Z flag will be set if the remainder is '0' and cleared otherwise. The C flag is used to implement the divide algorithm and its final value should not be used.

The 's' bits select the address of the source (divisor) register.
The 't' bits select the address of the source (dividend) register.

Note 1: For the fractional divide to be effective, Wm must be less than Wn. If Wm is greater than or equal to Wn, unexpected results will occur because the fractional result will be greater than or equal to 1.0. When this occurs, the OV Status bit will be set, and the quotient and remainder should not be used.

2: Dividing by zero will initiate an arithmetic error trap during the first cycle of execution.

3: This instruction is interruptible on each instruction cycle boundary.

Words: 1

Cycles: 6 (plus 1 for REPEAT instruction execution)

Example 1:

```

DIV2.S

Signed Integer Divide (W1:W0 Preserved)

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
							X

Syntax: {label:} DIV2.S{W} Wm, Wn
DIV2.SD Wm, Wn

Operands: Wm ∈ [W0 ... W15] for word operation
Wm ∈ [W0, W2, W4 ... W14] for double operation
Wn ∈ [W2 ... W15]

Operation: For Word Operation (default):
W(m+1):Wm/Wn → Wm; Remainder → W(m+1)
For Double Operation (DIV2.SD):
W(m+1):Wm/Wn → Wm; Remainder → W(m+1)

Status Affected: C, N, OV, Z

Encoding:

1101	1000	0ttt	tvvv	v110	ssss

Description: Iterative, signed integer 32-bit by 16-bit divide to a 16-bit quotient and a 16-bit remainder. The sign of the remainder will be the same as that of the dividend. Wm must be an even number and holds the least significant word of the dividend. The most significant word of the dividend is held in W(m+1).

This instruction must be executed 6 times to generate the correct quotient and remainder. This may only be achieved by executing a REPEAT with an iteration count of 5 (i.e., 5+1 iterations in all) and the DIV2.S instruction as its target.

The N flag will be set if the remainder is negative and cleared otherwise. The OV flag will be set if the divide operation resulted in an overflow and cleared otherwise. The Z flag will be set if the remainder is '0' and cleared otherwise. The C flag is used to implement the divide algorithm and its final value should not be used.

The 's' bits select the address of the source (divisor) register.
The 't' bits select the address of the source (dividend, most significant word) register.
The 'v' bits select the address of the source (dividend, least significant word) register.

Note 1: The extension .D in the instruction denotes a double-word (32-bit) dividend rather than a word dividend. You may use a .W extension to denote a word operation, but it is not required.

2: Unexpected results will occur if the quotient can not be represented in 16 bits. When this occurs for the double operation (DIV2.SD), the OV Status bit will be set, and the quotient and remainder should not be used. For the word operation (DIV2.S), only one type of overflow may occur (0x8000/0xFFFF = +32768 or 0x00008000), which allows the OV Status bit to interpret the result.

3: Dividing by zero will initiate an arithmetic error trap during the first cycle of execution.

4: This instruction is interruptible on each instruction cycle boundary.

DO

Initialize Hardware Loop Literal

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
				X	X		

Syntax: {label:} DO #lit14, Expr

Operands: lit14 ∈ [0 ... 16383]
Expr may be an absolute address, label or expression.
Expr is resolved by the linker to a Slit16, where Slit16 ∈ [-32768 ... +32767].

Operation: PUSH DO shadows (DCOUNT, DOEND, DOSTART)
(lit14) → DCOUNT
(PC) + 4 → PC
(PC) → DOSTART
(PC) + (2 * Slit16) → DOEND
Increment DL<2:0> (CORCON<10:8>)

Status Affected: DA

Encoding:

0000	1000	00kk	kkkk	kkkk	kkkk
0000	0000	nnnn	nnnn	nnnn	nnnn

Description: Initiate a no overhead hardware DO loop, which is executed (lit14 + 1) times. The DO loop begins at the address following the DO instruction and ends at the address 2 * Slit16 instruction words away. The 14-bit count value (lit14) supports a maximum loop count value of 16384 and the 16-bit offset value (Slit16) supports offsets of 32K instruction words in both directions.

When this instruction executes, DCOUNT, DOSTART and DOEND are first PUSHed into their respective shadow registers, and then updated with the new DO loop parameters specified by the instruction. The DO level count, DL<2:0> (CORCON<8:10>), is then incremented. After the DO loop completes execution, the PUSHed DCOUNT, DOSTART and DOEND registers are restored, and DL<2:0> are decremented.

The 'k' bits specify the loop count.
The 'n' bits are a signed literal that specifies the number of instructions that are offset from the PC to the last instruction executed in the loop.

Special Features, Restrictions:

The following features and restrictions apply to the DO instruction.

1. Using a loop count of 0 will result in the loop being executed one time.
2. Using a loop size of -2, -1 or 0 is invalid. Unexpected results may occur if these offsets are used.
3. The very last two instructions of the DO loop cannot be:
   - an instruction which changes program control flow
   - a DO or REPEAT instruction

   Unexpected results may occur if any of these instructions are used.
4. If a hard trap occurs in the second to last instruction or third to last instruction of a DO loop, the loop will not function properly. The hard trap includes exceptions of Priority Level 13 through Level 15, inclusive.

Note 1: The DO instruction is interruptible and supports 1 level of hardware nesting. Nesting up to an additional 5 levels may be provided in software by the user. See the specific device family reference manual for details.

2: The linker will convert the specified expression into the offset to be used.

Words: 2

Cycles: 2

DO

Initialize Hardware Loop Literal

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
						X	X

Syntax: {label:} DO #lit15, Expr

Operands: lit15 ∈ [0 ... 32767]
Expr may be an absolute address, label or expression.
Expr is resolved by the linker to a Slit16, where Slit16 ∈ [-32768 ... +32767].

Operation: PUSH DO shadows (DCOUNT, DOEND, DOSTART)
(lit15) → DCOUNT
(PC) + 4 → PC
(PC) → DOSTART
(PC) + (2 * Slit16) → DOEND
Increment DL<2:0> (CORCON<10:8>)

Status Affected: DA

Encoding:

0000	1000	0kkk	kkkk	kkkk	kkkk
0000	0000	nnnn	nnnn	nnnn	nnnn

Description: Initiate a no overhead hardware DO loop, which is executed (lit15 + 1) times. The DO loop begins at the address following the DO instruction and ends at the address 2 * Slit16 instruction words away. The 15-bit count value (lit15) supports a maximum loop count value of 32768 and the 16-bit offset value (Slit16) supports offsets of 32K instruction words in both directions.

When this instruction executes, DCOUNT, DOSTART and DOEND are first PUSHed into their respective shadow registers, and then updated with the new DO loop parameters specified by the instruction. The DO level count, DL<2:0> bits (CORCON<8:10>), is then incremented. After the DO loop completes execution, the PUSHed DCOUNT, DOSTART and DOEND registers are restored and DL<2:0> are decremented.

The 'k' bits specify the loop count.
The 'n' bits are a signed literal that specifies the number of instructions that are offset from the PC to the last instruction executed in the loop.

Special Features, Restrictions:

The following features and restrictions apply to the DO instruction.

1. Using a loop count of 0 will result in the loop being executed one time.
2. Using a loop size of -2, -1 or 0 is invalid. Unexpected results may occur if these offsets are used.
3. The very last two instructions of the DO loop cannot be:
   - an instruction which changes program control flow
   - a DO or REPEAT instruction

   Unexpected results may occur if any of these instructions are used.
4. If a hard trap occurs in the second to last instruction or third to last instruction of a DO loop, the loop will not function properly. The hard trap includes exceptions of Priority Level 13 through Level 15, inclusive.
5. The first and last instructions of the DO loop should not be a PSV read, table read or table write.

Note 1: The DO instruction is interruptible and supports 1 level of hardware nesting. Nesting up to an additional 5 levels may be provided in software by the user. See the specific device family reference manual for details.

2: The linker will convert the specified expression into the offset to be used.

DO

Initialize Hardware Loop Wn

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
				X	X		

Syntax: {label:} DO Wn, Expr

Operands: Wn ∈ [W0 ... W15]
Expr may be an absolute address, label or expression.
Expr is resolved by the linker to a Slit16, where Slit16 ∈ [-32768 ... +32767].

Operation: PUSH Shadows (DCOUNT, DOEND, DOSTART)
(Wn<13:0>) → DCOUNT
(PC) + 4 → PC
(PC) → DOSTART
(PC) + (2 * Slit16) → DOEND
Increment DL<2:0> (CORCON<10:8>)

Status Affected: DA

Encoding:

0000	1000	1000	0000	0000	ssss
0000	0000	nnnn	nnnn	nnnn	nnnn

Description: Initiate a no overhead hardware DO loop, which is executed (Wn + 1) times. The DO loop begins at the address following the DO instruction and ends at the address 2 * Slit16 instruction words away. The lower 14 bits of Wn support a maximum count value of 16384 and the 16-bit offset value (Slit16) supports offsets of 32K instruction words in both directions.

When this instruction executes, DCOUNT, DOSTART and DOEND are first PUSHed into their respective shadow registers, and then updated with the new DO loop parameters specified by the instruction. The DO level count, DL<2:0> (CORCON<8:10>), is then incremented. After the DO loop completes execution, the PUSHed DCOUNT, DOSTART and DOEND registers are restored, and DL<2:0> are decremented.

The 's' bits specify the register Wn that contains the loop count.
The 'n' bits are a signed literal that specifies the number of instructions that are offset from (PC + 4), which is the last instruction executed in the loop.

Special Features, Restrictions:

The following features and restrictions apply to the DO instruction.

1. Using a loop count of 0 will result in the loop being executed one time.
2. Using an offset of -2, -1 or 0 is invalid. Unexpected results may occur if these offsets are used.
3. The very last two instructions of the DO loop cannot be:
   - an instruction which changes program control flow
   - a DO or REPEAT instruction

   Unexpected results may occur if these last instructions are used.

Note 1: The DO instruction is interruptible and supports 1 level of nesting. Nesting up to an additional 5 levels may be provided in software by the user. See the specific device family reference manual for details.

2: The linker will convert the specified expression into the offset to be used.

DO

Initialize Hardware Loop Wn

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
						X	X

Syntax: {label:} DO Wn, Expr

Operands: Wn ∈ [W0 ... W15]
Expr may be an absolute address, label or expression.
Expr is resolved by the linker to a Slit16, where Slit16 ∈ [-32768 ... +32767].

Operation: PUSH Shadows (DCOUNT, DOEND, DOSTART)
(Wn) → DCOUNT
(PC) + 4 → PC
(PC) → DOSTART
(PC) + (2 * Slit16) → DOEND
Increment DL<2:0> (CORCON<10:8>)

Status Affected: DA

Encoding:

0000	1000	1000	0000	0000	ssss
0000	0000	nnnn	nnnn	nnnn	nnnn

Description: Initiate a no overhead hardware DO loop, which is executed (Wn + 1) times. The DO loop begins at the address following the DO instruction and ends at the address 2 * Slit16 instruction words away. The 16 bits of Wn support a maximum count value of 65536 and the 16-bit offset value (Slit16) supports offsets of 32K instruction words in both directions.

When this instruction executes, DCOUNT, DOSTART and DOEND are first PUSHed into their respective shadow registers, and then updated with the new DO loop parameters specified by the instruction. The DO level count, DL<2:0> (CORCON<8:10>), is then incremented. After the DO loop completes execution, the PUSHed DCOUNT, DOSTART and DOEND registers are restored, and DL<2:0> are decremented.

The 's' bits specify the register Wn that contains the loop count.
The 'n' bits are a signed literal that specifies the number of instructions that are offset from (PC + 4), which is the last instruction executed in the loop.

Special Features, Restrictions:

The following features and restrictions apply to the DO instruction.

1. Using a loop count of 0 will result in the loop being executed one time.
2. Using an offset of -2, -1 or 0 is invalid. Unexpected results may occur if these offsets are used.
3. The very last two instructions of the DO loop cannot be:
   - an instruction which changes program control flow
   - a DO or REPEAT instruction

   Unexpected results may occur if these last instructions are used.
4. The first and last instructions of the DO loop should not be a PSV read, table read or table write.

Note 1: The DO instruction is interruptible and supports 1 level of nesting. Nesting up to an additional 5 levels may be provided in software by the user. See the specific device family reference manual for details.

2: The linker will convert the specified expression into the offset to be used.

ED

Euclidean Distance (No Accumulate)

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
				X	X	X	X

Syntax:

{label:}	ED	Wm * Wm,	Acc,	[Wx],	[Wy],	Wxd
				[Wx] + = kx,	[Wy] + = ky,	
				[Wx] – = kx,	[Wy] – = ky,	
				[W9 + W12],	[W11 + W12],	

Operands:

Acc ∈ [A,B]
Wm * Wm ∈ [W4 * W4, W5 * W5, W6 * W6, W7 * W7]
Wx ∈ [W8, W9]; kx ∈ [-6, -4, -2, 2, 4, 6]
Wy ∈ [W10, W11]; ky ∈ [-6, -4, -2, 2, 4, 6]
Wxd ∈ [W4 ... W7]

Operation:

(Wm) * (Wm) → Acc(A or B)
([Wx] – [Wy]) → Wxd
(Wx) + kx → Wx
(Wy) + ky → Wy

Status Affected:

OA, OB, OAB, SA, SB, SAB

Encoding:

1111	00mm	A1xx	00ii	iijj	jj11

Description:

Compute the square of Wm, and compute the difference of the prefetch values specified by [Wx] and [Wy]. The results of Wm * Wm are sign-extended to 40 bits and stored in the specified accumulator. The results of [Wx] – [Wy] are stored in Wxd, which may be the same as Wm.

Operands, Wx, Wxd and Wyd, specify the prefetch operations which support Indirect and Register Offset Addressing, as described in **Section 4.15.1 "MAC Prefetches"**.

The 'm' bits select the operand register Wm for the square.
The 'A' bit selects the accumulator for the result.
The 'x' bits select the prefetch difference Wxd destination.
The 'i' bits select the Wx prefetch operation.
The 'j' bits select the Wy prefetch operation.

EXCH

Exchange Wns and Wnd

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax: {label:} EXCH Wns, Wnd

Operands: Wns ∈ [W0 ... W15]
Wnd ∈ [W0 ... W15]

Operation: (Wns) ↔ (Wnd)

Status Affected: None

Encoding:

1111	1101	0000	0ddd	d000	ssss

Description: Exchange the word contents of two Working registers. Register Direct Addressing must be used for Wns and Wnd.

The 'd' bits select the address of the first register.
The 's' bits select the address of the second register.

Note: This instruction only executes in Word mode.

Words: 1

Cycles: 1

Example 1:

```
EXCH  W1, W9     ; Exchange the contents of W1 and W9
```

	Before Instruction
W1	55FF

FBCL

Find First Bit Change from Left

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax: {label:} FBCL Ws, Wnd
[Ws],
[Ws++],
[Ws--],
[++Ws],
[--Ws],

Operands: Ws ∈ [W0 ... W15]
Wnd ∈ [W0 ... W15]

Operation:
```
Max_Shift = 15
Sign = (Ws) & 0x8000
Temp = (Ws) << 1
Shift = 0
While ( (Shift < Max_Shift) && (Temp & 0x8000) == Sign) )
   Temp = Temp << 1
   Shift = Shift + 1
-Shift → (Wnd)
```

Status Affected: C

Encoding:

1101	1111	0000	0ddd	dppp	ssss

Description: Find the first occurrence of a one (for a positive value) or zero (for a negative value), starting from the Most Significant bit after the sign bit of Ws and working towards the Least Significant bit of the word operand. The bit number result is sign-extended to 16 bits and placed in Wnd.

The next Most Significant bit after the sign bit is allocated bit number 0 and the Least Significant bit is allocated bit number -14. This bit ordering allows for the immediate use of Wd with the SFTAC instruction for scaling values up. If a bit change is not found, a result of -15 is returned and the C flag is set. When a bit change is found, the C flag is cleared.

The ‘d’ bits select the destination register.
The ‘p’ bits select the source addressing mode.
The ‘s’ bits select the source register.

Note: This instruction operates in Word mode only.

Words: 1

Cycles: 1(1)

Note 1: In dsPIC33E, dsPIC33C and PIC24E devices, the listed cycle count does not apply to read and Read-Modify-Write operations on non-CPU Special Function Registers. For more details, see **Note 3** in **Section 3.2.1 “Multicycle Instructions”**.

Example 1:

```
FBCL  W1, W9          ; Find 1st bit change from left in W1
                      ; and store result to W9

Operands: Ws ∈ [W0 ... W15]
Wnd ∈ [W0 ... W15]

Operation:
```
Max_Shift = 17
Temp = (Ws)
Shift = 1
While ( (Shift < Max_Shift) && !(Temp & 0x8000) )
   Temp = Temp << 1
   Shift = Shift + 1
If (Shift == Max_Shift)
   0 → (Wnd)
Else
   Shift → (Wnd)
```

Status Affected: C

Encoding:

1100	1111	1000	0ddd	dppp	ssss

Description: Finds the first occurrence of a one starting from the Most Significant bit of Ws and working towards the Least Significant bit of the word operand. The bit number result is zero-extended to 16 bits and placed in Wnd.

Bit numbering begins with the Most Significant bit (allocated number 1) and advances to the Least Significant bit (allocated number 16). A result of zero indicates a '1' was not found and the C flag will be set. If a '1' is found, the C flag is cleared.

The 'd' bits select the destination register.
The 'p' bits select the source addressing mode.
The 's' bits select the source register.

Note: This instruction operates in Word mode only.

Words: 1

Cycles: 1(1)

Note 1: In dsPIC33E, dsPIC33C and PIC24E devices, the listed cycle count does not apply to read and Read-Modify-Write operations on non-CPU Special Function Registers. For more details, see **Note 3** in **Section 3.2.1 "Multicycle Instructions"**.

Example 1:

```
FF1L  W2, W5       ; Find the 1st one from the left in W2
                   ; and store result to W5
```

	Before Instruction	After Instruction
W2	000A	000A
W5	BBBB	000D

FLIM

Force (Signed) Data Range Limit

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
							X

Syntax:

```
{label:}  FLIM  Wb,  Ws,
                     [Ws],
                     [Ws++],
                     [Ws--],
                     [++Ws],
                     [--Ws],
```

Operands:

Ws ∈ [W0 ... W15];
Wb ∈ [W0, W2, W4, W6, W8, W10, W12, W14];

Operation:

If (Ws) > (Wb)
Then
  (Wb) → (Ws);
  0 → Z; 0 → N; 0 → OV;
If (Ws) < (Wb+1)
Then
  (Wb+1) → Ws;
  0 → Z; 1 → N; 0 → OV;
Else
  1→ Z; 0 → N; 0 → OV;

N, Z, OV

Encoding:

1110	0100	0www	w000	0ppp	ssss

Description:

Simultaneously compare a 16-bit signed data value in Ws to a maximum signed limit value held in Wb and a minimum signed limit value held in W(b+1).

If Ws is greater than Wb, set Ws to the limit value held in Wb. The Z, N and OV Status bits are set such that a subsequent BRA GT instruction will take a branch.

If Ws is less than W(b+1), set Ws to the limit value held in W(b+1). The Z, N and OV Status bits are set such that a subsequent BRA LT instruction will take a branch.

If Ws is less than or equal to the maximum limit in Wb, and greater than or equal to the minimum limit in W(b+1), Ws is not modified (i.e., data is within range and limits are not applied). The Z Status bit is set such that a subsequent BRA Z instruction will take a branch.

The OV Status bit is always cleared by this instruction.

The ‘s’ bits select the address of the source (data value) register.
The ‘w’ bits select the address of the base (data limit) register.
The ‘p’ bits select the source addressing mode.

Note 1: Although the instruction assumes signed values for all operands, both upper and lower limit values may be of the same sign.

2: The Status bits are set based upon the value loaded into Wnd.

3: If the operand is greater than the maximum limit value in Wb, the CPU will write back the Wb value, regardless of whether the operand is less than the minimum value held in W(b+1) or not.

FLIM.V

Force (Signed) Data Range Limit with Limit Excess Result

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
							X

Syntax:

{label:}	FLIM.V	Wb,	Ws,	Wnd
			[Ws],	
			[Ws++],	
			[Ws--],	
			[++Ws],	
			[--Ws],	

Operands:

Ws ∈ [W0 ... W15];
Wb ∈ [W0, W2, W4, W6, W8, W10, W12, W14];
Wnd ∈ [W0 ... W15]

Operation:

If (Ws) > (Wb)
Then
(0x0001 → Wnd OR (Ws–Wb) → Wnd;
(Wb) → (Ws);
0 → Z; 0 → N; 0 → OV;)
If (Ws) < (Wb+1)
Then
(0xFFFF → Wnd OR (Ws–W(b+1)) → Wnd;
W(b+1) → Ws;
0 → Z; 1 → N; 0 → OV;)
Else
(0 → Wnd;
1 → Z; 0 → N; 0 → OV;)

N, Z, OV

Encoding:

1110	0101	xwww	wddd	dppp	ssss

Description:

Simultaneously compare a 16-bit signed data value in Ws to a maximum signed limit value held in Wb and a minimum signed limit value held in W(b+1). Write the limit excess value into Wnd.

If Ws is greater than Wb, either write the (signed) value by which the limit is exceeded to Wnd (`FLIM.V`, where instruction bit x = `1`) or set Wnd to +1 (`FLIM`, where instruction bit x = `0`). In both cases, set Ws to the limit value held in Wb. Whenever Ws is greater than Wb, Wnd will always be a positive value. The Z, N and OV Status bits are set such that a subsequent `BRA GT` instruction will take a branch.

If Ws is less than W(b+1), either write the (signed) value by which the limit is exceeded to Wnd (`FLIM.V`, where instruction bit x = `1`) or set Wnd to -1 (`FLIM`, where instruction bit x = `0`). In both cases, set Ws to the limit value held in W(b+1). Whenever Ws is less than W(b+1), Wnd will always be a negative value. The Z, N and OV Status bits are set such that a subsequent `BRA LT` instruction will take a branch.

If Ws is less than or equal to the maximum limit in Wb, and greater than or equal to the minimum limit in W(b+1), Ws is not modified (i.e., data is within range and limits are not applied). Wnd is cleared and the Z Status bit is set such that a subsequent `BRA Z` instruction will take a branch.

The OV Status bit is always cleared by this instruction.
The 's' bits select the address of the source (data value) register.
The 'w' bits select the address of the base (data limit) register.
The 'd' bits select the address of the destination (limit test result) register.
The 'p' bits select the source addressing mode.
The 'x' bit defines the presence and result format for Wnd.

Note 1: Although the instruction assumes signed values for all operands, both upper and lower limit values may be of the same sign.
2: The Status bits are set based upon the value loaded into Wnd.
3: If the operand is greater than the maximum limit value in Wb, the CPU will write back the Wb value, regardless of whether the operand is less than the minimum value held in W(b+1) or not.

GOTO

Unconditional Jump

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax: {label:} GOTO Expr

Operands: Expr may be label or expression (but not a literal).
Expr is resolved by the linker to a lit23, where lit23 ∈ [0 ... 8388606].

Operation: lit23 → PC
NOP → Instruction Register

Status Affected: None

Encoding:

1st word	0000	0100	nnnn	nnnn	nnnn	nnn0
2nd word	0000	0000	0000	0000	0nnn	nnnn

Description: Unconditional jump to anywhere within the 4M instruction word program memory range. The PC is loaded with the 23-bit literal specified in the instruction. Since the PC must always reside on an even address boundary, lit23<0> is ignored.

The 'n' bits form the target address.

Note: The linker will resolve the specified expression into the lit23 to be used.

Words: 2

Cycles: 2 (PIC24F, PIC24H, dsPIC30F, dsPIC33F)
4 (PIC24E, dsPIC33E, dsPIC33C)

Example 1:

```
026000          GOTO   _THERE             ; Jump to _THERE
026004          MOV    W0, W1
   .            ...
   .            ...
027844 _THERE:  MOV    #0x400, W2         ; Code execution
027846          ...                       ; resumes here
```

	Before Instruction		After Instruction

   .            ...
026000          GOTO   _code+2             ; Jump to _code+2
026004          ...
```

	Before Instruction		After Instruction
PC	02 6000	PC	00 0102
SR	0000	SR	0000

GOTO

Unconditional Indirect Jump

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X		X	X		

Syntax: {label:} GOTO Wn

Operands: Wn ∈ [W0 ... W15]

Operation: 0 → PC<22:16>
(Wn<15:1>) → PC<15:1>
0 → PC<0>
NOP → Instruction Register

Status Affected: None

Encoding:

0000	0001	0100	0000	0000	ssss

Description: Unconditional indirect jump within the first 32K words of program memory. Zero is loaded into PC<22:16> and the value specified in (Wn) is loaded into PC<15:1>. Since the PC must always reside on an even address boundary, Wn<0> is ignored.

The 's' bits select the source register.

Words: 1

Cycles: 2

Example 1:

```
006000          GOTO   W4                ; Jump unconditionally
006002          MOV    W0, W1            ; to 16-bit value in W4

GOTO.L

Unconditional Indirect Jump Long

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
			X			X	X

Syntax: {label:} GOTO.L Wn

Operands: Wn ∈ [W0, W2, W4, W6, W8, W10, W12]

Operation: PC<23> → PC<23> (see text); (Wn+1)<6:0> → PC<22:16>; (Wn) → PC<15:0>

Status Affected: None

Encoding:

0000	0001	1www	w100	0000	ssss

Description: Unconditional indirect jump to any user program memory address.

The Least Significant 7 bits of (Wn+1) are loaded in PC<22:16> and the 16-bit value (Wn) is loaded into PC<15:0>.

PC<23> is not modified by this instruction.

The contents of (Wn+1)<15:7> are ignored.

The value of Wn<0> is also ignored and PC<0> is always set to '0'.

GOTO is a two-cycle instruction.

The 's' bits select the address of the Wn source register.
The 'w' bits specify the address of the Wn+1 source register.

Words: 1

Cycles: 4

Example 1:

```
026000          GOTO.L  W4              ; Call _FIR subroutine

INC

Increment f

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax: {label:} INC{.B} f {,WREG}

Operands: f ∈ [0 ... 8191]

Operation: (f) + 1 → destination designated by D

Status Affected: DC, N, OV, Z, C

Encoding:

1110	1100	0BDf	ffff	ffff	ffff

Description: Add one to the contents of the file register and place the result in the destination register. The optional WREG operand determines the destination register. If WREG is specified, the result is stored in WREG. If WREG is not specified, the result is stored in the file register.

The 'B' bit selects byte or word operation ('0' for word, '1' for byte).
The 'D' bit selects the destination register ('0' for WREG, '1' for file register).
The 'f' bits select the address of the file register.

Note 1: The extension `.B` in the instruction denotes a byte operation rather than a word operation. You may use a `.W` extension to denote a word operation, but it is not required.

2: The WREG is set to Working register W0.

Words: 1

Cycles: 1(1)

Note 1: In dsPIC33E, dsPIC33C and PIC24E devices, the listed cycle count does not apply to read and Read-Modify-Write operations on non-CPU Special Function Registers. For more details, see **Note 3** in **Section 3.2.1 "Multicycle Instructions"**.

INC

Increment Ws

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax:	{label:}	INC{.B}	Ws,	Wd
			[Ws],	[Wd]
			[Ws++],	[Wd++]
			[Ws--],	[Wd--]
			[++Ws],	[++Wd]
			[--Ws],	[--Wd]

Operands: Ws ∈ [W0 ... W15]
Wd ∈ [W0 ... W15]

Operation: (Ws) + 1 → Wd

Status Affected: DC, N, OV, Z, C

Encoding:

1110	1000	0Bqq	qddd	dppp	ssss

Description: Add one to the contents of the source register Ws and place the result in the destination register Wd. Register Direct or Indirect Addressing may be used for Ws and Wd.

The 'B' bit selects byte or word operation ('0' for word, '1' for byte).
The 'q' bits select the destination addressing mode.
The 'd' bits select the destination register.
The 'p' bits select the source addressing mode.
The 's' bits select the source register.

Note: The extension `.B` in the instruction denotes a byte operation rather than a word operation. You may use a `.W` extension to denote a word operation, but it is not required.

INC2

Increment Ws by 2

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax: {label:} INC2{.B} Ws, Wd
[Ws], [Wd]
[Ws++], [Wd++]
[Ws--], [Wd--]
[++Ws], [++Wd]
[--Ws], [--Wd]

Operands: Ws ∈ [W0 ... W15]
Wd ∈ [W0 ... W15]

Operation: (Ws) + 2 → Wd

Status Affected: DC, N, OV, Z, C

Encoding:

1110	1000	1Bqq	qddd	dppp	ssss

Description: Add two to the contents of the source register Ws and place the result in the destination register Wd. Register Direct or Indirect Addressing may be used for Ws and Wd.

The 'B' bit selects byte or word operation ('0' for word, '1' for byte).
The 'q' bits select the destination addressing mode.
The 'd' bits select the destination register.
The 'p' bits select the source addressing mode.
The 's' bits select the source register.

Note: The extension `.B` in the instruction denotes a byte operation rather than a word operation. You may use a `.W` extension to denote a word operation, but it is not required.

Words: 1

Cycles: 1(1)

Note 1: In dsPIC33E, dsPIC33C and PIC24E devices, the listed cycle count does not apply to read and Read-Modify-Write operations on non-CPU Special Function Registers. For more details, see **Note 3** in **Section 3.2.1 "Multicycle Instructions"**.

Example 1:

```
INC2.B  W1, [++W2]   ; Pre-increment W2
                     ; Increment by 2 and store to W1
                     ; (Byte mode)
```

IOR

Inclusive OR f and WREG

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax: {label:} IOR{.B} f {,WREG}

Operands: f ∈ [0 ... 8191]

Operation: (f).IOR.(WREG) → destination designated by D

Status Affected: N, Z

Encoding:

1011	0111	0BDf	ffff	ffff	ffff

Description: Compute the logical inclusive OR operation of the contents of the Working register WREG and the contents of the file register, and place the result in the destination register. The optional WREG operand determines the destination register. If WREG is specified, the result is stored in WREG. If WREG is not specified, the result is stored in the file register.

The 'B' bit selects byte or word operation ('0' for word, '1' for byte).
The 'D' bit selects the destination register ('0' for WREG, '1' for file register).
The 'f' bits select the address of the file register.

Note 1: The extension .B in the instruction denotes a byte operation rather than a word operation. You may use a .W extension to denote a word operation, but it is not required.

2: The WREG is set to Working register W0.

Words: 1

Cycles: 1(1)

Note 1: In dsPIC33E, dsPIC33C and PIC24E devices, the listed cycle count does not apply to read and Read-Modify-Write operations on non-CPU Special Function Registers. For more details, see **Note 3** in **Section 3.2.1 "Multicycle Instructions"**.

Example 1:

```
IOR.B  0x1000        ; IOR WREG to (0x1000) (Byte mode)
                     ; (Byte mode)
```

	Before Instruction		After Instruction

Example 2:

```
IOR    0x1000, WREG   ; IOR (0x1000) to WREG
                      ; (Word mode)
```

	Before Instruction		After Instruction
WREG	1234	WREG	1FBF
Data 1000	0FAB	Data 1000	0FAB
SR	0008	(N = 1) SR	0000

IOR

Inclusive OR Literal and Wn

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax: {label:} IOR{.B} #lit10, Wn

Operands: lit10 ∈ [0 ... 255] for byte operation
lit10 ∈ [0 ... 1023] for word operation
Wn ∈ [W0 ... W15]

Operation: lit10.IOR.(Wn) → Wn

Status Affected: N, Z

Encoding:

1011	0011	0Bkk	kkkk	kkkk	dddd

Description: Compute the logical inclusive OR operation of the 10-bit literal operand and the contents of the Working register Wn, and place the result back into the Working register Wn.

The 'B' bit selects byte or word operation ('0' for word, '1' for byte).
The 'k' bits specify the literal operand.
The 'd' bits select the address of the Working register.

Note 1: The extension .B in the instruction denotes a byte operation rather than a word operation. You may use a .W extension to denote a word operation, but it is not required.

2: For byte operations, the literal must be specified as an unsigned value [0:255]. See **Section 4.6 "Using 10-Bit Literal Operands"** for information on using 10-bit literal operands in Byte mode.

Words: 1

Cycles: 1

Example 1:

```
IOR.B  #0xAA, W9      ; IOR 0xAA to W9
                      ; (Byte mode)

IOR

Inclusive OR Wb and Short Literal

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax:

{label:}	IOR{.B}	Wb,	#lit5,	Wd
				[Wd]
				[Wd++]
				[Wd--]
				[++Wd]
				[--Wd]

Operands:
Wb ∈ [W0 ... W15]
lit5 ∈ [0 ... 31]
Wd ∈ [W0 ... W15]

Operation: (Wb).IOR.lit5 → Wd

Status Affected: N, Z

Encoding:

0111	0www	wBqq	qddd	d11k	kkkk

Description:
Compute the logical inclusive OR operation of the contents of the base register Wb and the 5-bit literal operand, and place the result in the destination register Wd. Register Direct Addressing must be used for Wb. Either Register Direct or Indirect Addressing may be used for Wd.

The 'w' bits select the address of the base register.
The 'B' bit selects byte or word operation ('0' for word, '1' for byte).
The 'q' bits select the destination addressing mode.
The 'd' bits select the destination register.
The 'k' bits provide the literal operand, a five-bit integer number.

Note: The extension `.B` in the instruction denotes a byte operation rather than a word operation. You may use a `.W` extension to denote a word operation, but it is not required.

Words: 1

Cycles: 1

Example 1:

```
IOR.B  W1, #0x5, [W9++]    ; IOR W1 and 0x5 (Byte mode)
                           ; Store to [W9]
                           ; Post-increment W9

LAC

Load Accumulator

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
				X	X	X	X

Syntax:

{label:}	LAC	Ws,	{#Slit4,}	Acc
		[Ws],		
		[Ws++],		
		[Ws--],		
		[--Ws],		
		[++Ws],		
		[Ws+Wb],		

Operands:

Ws ∈ [W0 ... W15]
Wb ∈ [W0 ... W15]
Slit4 ∈ [-8 ... +7]
Acc ∈ [A,B]

Operation: $Shift_{Slit4}(Extend(Ws)) \rightarrow Acc(A \text{ or } B)$

Status Affected: OA, OB, OAB, SA, SB, SAB

Encoding:

1100	1010	Awww	wrrr	rggg	ssss

Description:

Read the contents of the source register. Optionally perform a signed 4-bit shift and store the result in the specified accumulator. The shift range is -8:7, where a negative operand indicates an arithmetic left shift and a positive operand indicates an arithmetic right shift. The data stored in the source register is assumed to be 1.15 fractional data, and is automatically sign-extended (through bit 39) and zero-backfilled (bits<15:0>) prior to shifting.

The 'A' bit specifies the destination accumulator.
The 'w' bits specify the offset register Wb.
The 'r' bits encode the accumulator preshift.
The 'g' bits select the source addressing mode.
The 's' bits specify the source register Ws.

Note: If the operation moves more than sign-extension data into the Accumulator Upper register (ACCxU), or causes a saturation, the appropriate overflow and saturation bits will be set.

Words: 1

Cycles: 1(1)

Note 1: In dsPIC33E, dsPIC33C and PIC24E devices, the listed cycle count does not apply to read and Read-Modify-Write operations on non-CPU Special Function Registers. For more details, see **Note 3** in **Section 3.2.1 "Multicycle Instructions"**.

LAC.D

Load Accumulator Double

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
							X

Syntax:

{label:}	LAC.D	Ws,	[, #Slit4],	Acc
		[Ws],		
		[Ws++]		
		[Ws--]		
		[--Ws],		
		[++Ws]		

Operands: Register Direct: Wns ∈ [W0, W2, W4, W6, W8, W10, W12, W14];
Register Indirect: Wns ∈ [W0 ... W15];
Slit4 ∈ [-8 ... +7] Acc ∈ [A,B]

Operation: $Shift_{Slit}4(Extend(Ws)) \rightarrow ACC\ (A,B)$

Status Affected: OA, SA *or* OB, SB

Encoding:

1101	1011	A000	0rrr	rppp	ssss

Description: Read the contents of the source register. Optionally perform a signed 4-bit shift and store the result in the specified accumulator. The shift range is -8:7, where a negative operand indicates an arithmetic left shift and a positive operand indicates an arithmetic right shift. The data stored in the source register is assumed to be 1.31 fractional data, and is automatically sign-extended (through bit 39) and zero-backfilled (bits<15:0>) prior to shifting.

The 'A' bit specifies the destination accumulator.
The 's' bits specify the source register Wns.
The 'p' bits select the source addressing mode.
The 'r' bits encode the optional operand Slit4, which determines the amount of the accumulator preshift; if the operand Slit4 is absent, a '0' is encoded.

See Table 5-7 for modifier addressing information.

Note 1: Unlike the LAC instruction, the LAC.D instruction does not support Indirect with Register Offset Addressing mode.

2: Positive values of operand Slit4 represent arithmetic shift right. Negative values of operand Slit4 represent shift left.

3: The LAC.D instruction cannot be executed within a REPEAT loop.

Words: 1

Cycles: 2(1)

Note 1: In dsPIC33E, dsPIC33C and PIC24E devices, the listed cycle count does not apply to read and Read-Modify-Write operations on non-CPU Special Function Registers. For more details, see **Note 3** in **Section 3.2.1 "Multicycle Instructions"**.

© 2005-2018 Microchip Technology Inc.

LDSLV

Load Slave Processor Program RAM

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
							X

Syntax: {label:} LDSLV [Wns] [Wnd++] #lit2
[Wns++]

Operands: Wns ∈ [W0 ... W15];
Wnd ∈ [W0 ... W15];
lit2 ∈ [0 ... 3]

Operation: Master (EAs) → Slave EAd

Status Affected: None

Encoding:

0000	0011	00kk	0ddd	d0p1	ssss

Description: This instruction moves a single instruction word from the target Slave PRAM image (held in the Master program space Flash) into the Slave PRAM. The source address must be located within PSV address space (i.e., DSRPAG ≥ 0x200). The destination address uses DSWPAG and the destination EA to create a 24-bit Slave PS PRAM write address.

Starting with an aligned double instruction word destination address (see note), move the contents of the source Effective Address (in Master program space) to the destination Effective Address (in the Slave PRAM address space).

If the (single instruction word) destination address is even, capture the data in the Slave PRAM wrapper. If the (single instruction word) destination address is odd, the ECC parity bits are calculated from the current and captured source data (48-bits), then stored together with the data into the PRAM double instruction word destination Effective Address.

The target Slave processor is selected by the value defined by lit2.

The instruction may be regarded as a PSV operation, and hence, may be executed within a REPEAT loop to accelerate data processing.

The ‘s’ bits select the address of the source register.
The ‘d’ bits select the address of the destination register.
The ‘k’ bits select the target Slave processor.
The ‘p’ bit selects the destination addressing mode (see note).

Note 1: This instruction supports a subset of addressing modes. The Source Addressing mode bit field is constrained to 2 options and the Destination Addressing mode bit field is not required.

2: An aligned double instruction word destination address is an even address that addresses the least significant word of a double instruction word.

3: This instruction only supports Word mode.

Cycles: 1

LNK

Allocate Stack Frame

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X		X	X		

Syntax: {label:} LNK #lit14

Operands: lit14 ∈ [0 ... 16382]

Operation: (W14) → (TOS)
(W15) + 2 → W15
(W15) → W14
(W15) + lit14 → W15

Status Affected: None

Encoding:

1111	1010	00kk	kkkk	kkkk	kkk0

Description: This instruction allocates a stack frame of size lit14 bytes for a subroutine calling sequence. The stack frame is allocated by PUSHing the contents of the Frame Pointer (W14) onto the stack, storing the updated Stack Pointer (W15) to the Frame Pointer and then incrementing the Stack Pointer by the unsigned 14-bit literal operand. This instruction supports a maximum stack frame of 16382 bytes.

The 'k' bits specify the size of the stack frame.

Note: Since the Stack Pointer can only reside on a word boundary, lit14 must be even.

Logical Shift Right f

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax: {label:} LSR{.B} f {,WREG}

Operands: f ∈ [0 ... 8191]

Operation:

For Byte Operation:

0 → Dest<7>
(f<7:1>) → Dest<6:0>
(f<0>) → C

For Word Operation:

0 → Dest<15>
(f<15:1>) → Dest<14:0>
(f<0>) → C

Status Affected: N, Z, C

Encoding:

1101	0101	0BDf	ffff	ffff	ffff

Description: Shift the contents of the file register one bit to the right and place the result in the destination register. The Least Significant bit of the file register is shifted into the Carry bit of the STATUS Register. Zero is shifted into the Most Significant bit of the destination register.

The optional WREG operand determines the destination register. If WREG is specified, the result is stored in WREG. If WREG is not specified, the result is stored in the file register.

The 'B' bit selects byte or word operation ('0' for word, '1' for byte).
The 'D' bit selects the destination register ('0' for WREG, '1' for file register).
The 'f' bits select the address of the file register.

Note 1: The extension .B in the instruction denotes a byte operation rather than a word operation. You may use a .W extension to denote a word operation, but it is not required.

2: The WREG is set to Working register W0.

Words: 1

Cycles: 1(1)

Note 1: In dsPIC33E, dsPIC33C and PIC24E devices, the listed cycle count does not apply to read and Read-Modify-Write operations on non-CPU Special Function Registers. For more details, see **Note 3** in **Section 3.2.1 "Multicycle Instructions"**.

LSR

Logical Shift Right Ws

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax:

{label:}	LSR{.B}	Ws,	Wd
		[Ws],	[Wd]
		[Ws++],	[Wd++]
		[Ws--],	[Wd--]
		[++Ws],	[++Wd]
		[--Ws],	[--Wd]

Operands:

Ws ∈ [W0 ... W15]
Wd ∈ [W0 ... W15]

Operation:

For Byte Operation:
0 → Wd<7>
(Ws<7:1>) → Wd<6:0>
(Ws<0>) → C

For Word Operation:
0 → Wd<15>
(Ws<15:1>) → Wd<14:0>
(Ws<0>) → C

Status Affected: N, Z, C

Encoding:

1101	0001	0Bqq	qddd	dppp	ssss

Description:

Shift the contents of the source register Ws one bit to the right and place the result in the destination register Wd. The Least Significant bit of Ws is shifted into the Carry bit of the STATUS Register. Zero is shifted into the Most Significant bit of Wd. Either Register Direct or Indirect Addressing may be used for Ws and Wd.

The 'B' bit selects byte or word operation ('0' for word, '1' for byte).
The 'q' bits select the destination addressing mode.
The 'd' bits select the destination register.
The 'p' bits select the source addressing mode.
The 's' bits select the source register.

Note: The extension `.B` in the instruction denotes a byte operation rather than a word operation. You may use a `.W` extension to denote a word operation, but it is not required.

Words: 1

Cycles: 1(1)

Note 1: In dsPIC33E, dsPIC33C and PIC24E devices, the listed cycle count does not apply to read and Read-Modify-Write operations on non-CPU Special Function Registers. For more details, see **Note 3** in **Section 3.2.1 "Multicycle Instructions"**.

© 2005-2018 Microchip Technology Inc.

Example 1:

```
LSR.B  W0, W1     ; LSR W0 (Byte mode)
                  ; Store result to W1
```

	Before Instruction		After Instruction	
W0	FF03	W0	FF03	
W1	2378	W1	2301	
SR	0000	SR	0001	(C = 1)

Example 2:

```
LSR    W0, W1     ; LSR W0 (Word mode)
                  ; Store the result to W1
```

	Before Instruction		After Instruction
W0	8000	W0	8000
W1	2378	W1	4000
SR	0000	SR	0000

LSR

Logical Shift Right by Short Literal

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax: {label:} LSR Wb, #lit4, Wnd

Operands: Wb ∈ [W0 ... W15]
lit4 ∈ [0 ... 15]
Wnd ∈ [W0 ... W15]

Operation: lit4<3:0> → Shift_Val
0 → Wnd<15:15-Shift_Val + 1>
Wb<15:Shift_Val> → Wnd<15-Shift_Val:0>

Status Affected: N, Z

Encoding:

1101	1110	0www	wddd	d100	kkkk

Description: Logical shift right the contents of the source register Wb by the 4-bit unsigned literal and store the result in the destination register Wnd. Direct Addressing must be used for Wb and Wnd.

The 'w' bits select the address of the base register.
The 'd' bits select the destination register.
The 'k' bits provide the literal operand.

Note: This instruction operates in Word mode only.

Words: 1

Cycles: 1

Example 1:

```
LSR    W4, #14, W5    ; LSR W4 by 14
                      ; Store result to W5
```

	Before Instruction	After Instruction
W4	C800	C800
W5	1200	0003
SR	0000	0000

Example 2:

```
LSR    W4, #1, W5     ; LSR W4 by 1
                      ; Store result to W5
```

	Before Instruction	After Instruction

LSR

Logical Shift Right by Wns

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax: {label:} LSR Wb, Wns, Wnd

Operands: Wb ∈ [W0 ... W15]
Wns ∈ [W0 ...W15]
Wnd ∈ [W0 ... W15]

Operation: Wns<4:0> → Shift_Val
0 → Wnd<15:15-Shift_Val + 1>
Wb<15:Shift_Val> → Wnd<15 – Shift_Val:0>

Status Affected: N, Z

Encoding:

1101	1110	0www	wddd	d000	ssss

Description: Logical shift right the contents of the source register Wb by the 5 Least Significant bits of Wns (only up to 15 positions) and store the result in the destination register Wnd. Direct Addressing must be used for Wb and Wnd.

The ‘w’ bits select the address of the base register.
The ‘d’ bits select the destination register.
The ‘s’ bits select the source register.

Note 1: This instruction operates in Word mode only.
2: If Wns is greater than 15, Wnd will be loaded with 0x0.

Words: 1

Cycles: 1

Example 1:

```
LSR    W0, W1, W2     ; LSR W0 by W1
                      ; Store result to W2
```

	Before Instruction	After Instruction
W0	C00C	C00C
W1	0001	0001
W2	2390	6006
SR	0000	0000

Example 2:

```
LSR    W5, W4, W3     ; LSR W5 by W4
                      ; Store result to W3
```

MAC

Multiply and Accumulate

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
				X	X	X	X

Syntax: {label:} MAC Wm*Wn, Acc {,[Wx], Wxd} {,[Wy], Wyd} {,AWB}
{,[Wx] + = kx, Wxd} {,[Wy] + = ky, Wyd}
{,[Wx] – = kx, Wxd} {,[Wy] – = ky, Wyd}
{,[W9 + W12], Wxd} {,[W11 + W12], Wyd}

Operands:
Wm * Wn ∈ [W4 * W5, W4 * W6, W4 * W7, W5 * W6, W5 * W7, W6 * W7]
Acc ∈ [A,B]
Wx ∈ [W8, W9]; kx ∈ [-6, -4, -2, 2, 4, 6]; Wxd ∈ [W4 ... W7]
Wy ∈ [W10, W11]; ky ∈ [-6, -4, -2, 2, 4, 6]; Wyd ∈ [W4 ... W7]
AWB ∈ [W13, [W13] + = 2]

Operation:
(Acc(A or B)) + (Wm) * (Wn) → Acc(A or B)
([Wx]) → Wxd; (Wx) + kx → Wx
([Wy]) → Wyd; (Wy) + ky → Wy
(Acc(B or A)) rounded → AWB

Status Affected: OA, OB, OAB, SA, SB, SAB

Encoding:

1100	0mmm	A0xx	yyii	iijj	jjaa

Description:
Multiply the contents of two Working registers. Optionally prefetch operands in preparation for another MAC type instruction and optionally store the unspecified accumulator results. The 32-bit result of the signed multiply is sign-extended to 40 bits and added to the specified accumulator.

Operands, Wx, Wxd, Wy and Wyd, specify optional prefetch operations, which support Indirect and Register Offset Addressing, as described in **Section 4.14.1 "MAC Prefetches"**. Operand AWB specifies the optional store of the "other" accumulator, as described in **Section 4.15.4 "MAC Write-Back"**.

The 'm' bits select the operand registers Wm and Wn for the multiply.
The 'A' bit selects the accumulator for the result.
The 'x' bits select the prefetch Wxd destination.
The 'y' bits select the prefetch Wyd destination.
The 'i' bits select the Wx prefetch operation.
The 'j' bits select the Wy prefetch operation.
The 'a' bits select the accumulator Write-Back destination.

Note 1: The IF bit (CORCON<0>) determines if the multiply is fractional or an integer.
2: The US<1:0> bits (CORCON<13:12> in dsPIC33E/dsPIC33C, CORCON<12> in dsPIC30F/dsPIC33F) determine if the multiply is unsigned, signed or mixed-sign. Only dsPIC33E/dsPIC33C devices support mixed-sign multiplication.

Words: 1

Cycles: 1

MAC

Square and Accumulate

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
				X	X	X	X

Syntax:

{label:}	MAC	Wm * Wm, Acc	{,[Wx], Wxd}	{,[Wy], Wyd}
			{,[Wx] + = kx, Wxd}	{,[Wy] + = ky, Wyd}
			{,[Wx] – = kx, Wxd}	{,[Wy] – = ky, Wyd}
			{,[W9 + W12], Wxd}	{,[W11 + W12], Wyd}

Operands:

Wm * Wm ∈ [W4 * W4, W5 * W5, W6 * W6, W7 * W7]
Acc ∈ [A,B]
Wx ∈ [W8, W9]; kx ∈ [-6, -4, -2, 2, 4, 6]; Wxd ∈ [W4 ... W7]
Wy ∈ [W10, W11]; ky ∈ [-6, -4, -2, 2, 4, 6]; Wyd ∈ [W4 ... W7]

Operation:

(Acc(A or B)) + (Wm) * (Wm) → Acc(A or B)
([Wx]) → Wxd; (Wx) + kx → Wx
([Wy]) → Wyd; (Wy) + ky → Wy

Status Affected:

OA, OB, OAB, SA, SB, SAB

Encoding:

1111	00mm	A0xx	yyii	iijj	jj00

Description:

Square the contents of a Working register. Optionally prefetch operands in preparation for another MAC type instruction. The 32-bit result of the signed multiply is sign-extended to 40 bits and added to the specified accumulator.

Operands, Wx, Wxd, Wy and Wyd, specify optional prefetch operations, which support Indirect and Register Offset Addressing, as described in **Section 4.14.1 "MAC Prefetches"**.

The 'm' bits select the operand register Wm for the square.
The 'A' bit selects the accumulator for the result.
The 'x' bits select the prefetch Wxd destination.
The 'y' bits select the prefetch Wyd destination.
The 'i' bits select the Wx prefetch operation.
The 'j' bits select the Wy prefetch operation.

Note 1: The IF bit (CORCON<0>) determines if the multiply is fractional or an integer.

2: The US<1:0> bits (CORCON<13:12> in dsPIC33E/dsPIC33C, CORCON<12> in dsPIC30F/dsPIC33F) determine if the multiply is unsigned, signed or mixed-sign. Only dsPIC33E/dsPIC33C devices support mixed-sign multiplication.

MAX

Accumulator Force Maximum Data Range Limit

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
							X

Syntax: {label:} MAX Acc

Operands: Acc ∈ [A,B]

Operation:

```
If (MAX A) Then
   If ACCA – ACCB > 0 Then
      (ACCB → ACCA;
      0 → Z; 0 → N; 0 → OV;)
   Else
      (1 → Z; 0 → N; 0 → OV;)
If (MAX B) Then
   If ACCB – ACCA > 0 Then
      (ACCA → ACCB;
      0 → Z; 0 → N; 0 → OV;)
   Else
      (1 → Z; 0 → N; 0 → OV;)
```

Status Affected: N, OV, Z

Encoding:

1100	1110	A00x	x000	0000	0000

Description:

The target accumulator (defined in the instruction) is clamped to the maximum limit value previously loaded into the other accumulator (sign-extended 32-bit value). The comparison examines the full 40-bit value of the target accumulator, and will therefore, clamp an overflowed accumulator.

If the target accumulator is greater than the limit accumulator, load the target accumulator with the contents of the limit accumulator. The Z and N Status bits are set such that a subsequent `BRA GT` instruction will take a branch. In addition, Z is set such that a subsequent `MIN` instruction will execute as a `NOP` if the limit is exceeded. If the limit is not exceeded (Z = 1), the `MIN` instruction will execute as normal.

If the target accumulator is not greater than the limit accumulator, the target accumulator is unaffected. The Z Status bit is set such that a subsequent `BRA Z` instruction will take a branch.

The OV Status bit is always cleared by this instruction.

The 'A' bit specifies the destination accumulator.
The 'x' bits define the presence and result format for Wd.

Note: OA and SA or OB and SB Status bits are not modified by this instruction. Execute `SFTAC <AccX>, #0` after `MAX` operation to update DSP status to reflect contents of AccX.

MAX.V

Accumulator Force Maximum Data Range Limit with Limit Excess Result

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
							X

Syntax:

{label:} MAX.V Acc Wd
[Wd]
[Wd++]
[Wd--]
[++Wd]
[--Wd]

Operands:

Wd ∈ [W0 ... W15]
A ∈ [A,B]

Operation:

If (MAX A) Then
  If ACCA – ACCB > 0 Then
    (0x0001 → Wd or ACCA – ACCB → Wd (see text);
    ACCB → ACCA;
    0 → Z; 0 → N; 0 → OV;)
  Else
    (0 → Wd;
    1 → Z; 0 → N; 0 → OV;)
If (MAX B) Then
  If ACCB – ACCA > 0 Then
    (0x0001 → Wd or ACCB – ACCA → Wd (see text);
    ACCA → ACCB;
    1 → Z; 0 → N; 0 → OV;)
  Else
    (0 → Wd;
    1 → Z; 0 → N; 0 → OV;)

Status Affected: N, OV, Z

Encoding:

1100	1110	A00x	x000	0qqq	dddd

Description:

The target accumulator (defined in the instruction) is clamped to the maximum limit value previously loaded into the other accumulator. The comparison examines the full 40-bit value of the target accumulator, and will therefore, clamp an overflowed accumulator.

If the target accumulator is greater than the limit accumulator, load the target accumulator with the contents of the limit accumulator. For MAX (instruction bit field xx = 2'b10), set Wd to +1. For MAX.V (instruction bit field xx = 2'b11), write the (signed) value by which the limit is exceeded to Wd. This is sourced from the Least Significant 16 bits of the 40-bit result. If the limit is exceeded by a value greater than that which can be represented by a signed 16-bit number, saturate the Wd write to the maximum positive value (i.e., set Wd to 0x7FFF).

The Z and N Status bits are set such that a subsequent BRA GT instruction will take a branch if the limit is exceeded. In addition, Z is set such that a subsequent MIN{.V} instruction will execute as a NOP if the limit is exceeded. If the limit is not exceeded (Z = 1), the MIN{.V} instruction will execute as normal.

If the target accumulator is not greater than the limit accumulator, the target accumulator is unaffected and Wd is cleared. The Z Status bit is set such that a subsequent BRA Z instruction will take a branch.

The OV Status bit is always cleared by this instruction.

The 'A' bit specifies the destination accumulator.
The 'd' bits select the address of the destination register.
The 'q' bits select the destination addressing mode.
The 'x' bits define the presence and result format for Wd.

Note: OA and SA or OB and SB Status bits are not modified by this instruction. Execute SFTAC <AccX>, #0 after MAX.V operation to update DSP status to reflect contents of AccX.

   Else
      (0 → Wd;
      1 → Z; 0 → N; 0 → OV;)
```

Status Affected: N, OV, Z

Encoding:

1100	1110	A01x	x100	0000	0000

Description: If MINZ is executed when Z = 1 (see note), the target accumulator (defined in the instruction) is clamped to the minimum limit value previously loaded into the other accumulator. If MINZ is executed when Z = 0, the instruction is skipped (executed as a NOP).

The comparison examines the full 40-bit value of the target accumulator, and will therefore, clamp an overflowed accumulator.

If the target accumulator is less than the limit accumulator, load the target accumulator with the contents of the limit accumulator. The Z and N Status bits are set such that a subsequent BRA LT instruction will take a branch.

If the target accumulator is not less than the limit accumulator, the target accumulator is unaffected. The Z Status bit is set (Z = 1) such that a subsequent BRA Z instruction will take a branch.

The OV Status bit is always cleared by this instruction.

The 'A' bit specifies the destination accumulator.
The 'x' bits define the presence and result format for Wd.

Note 1: Execution of the accumulator maximum clamp instruction (MAX) is expected to be immediately followed by execution of the conditionally executed accumulator minimum clamp instruction (MINZ). If MAX resulted in a clamp condition (Z = 0), MINZ will be skipped. Use the unconditionally executed MIN instruction if it is required to be executed in isolation.

2: OA and SA or OB and SB Status bits are not modified by this instruction. Execute SFTAC <AccX>, #0 after MINZ execution to update DSP status to reflect the contents of AccX.

MINZ.V

Accumulator Force Minimum Data Range Limit with Limit Excess Result (Conditional Execution)

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
							X

Syntax: {label:} MINZ.V Acc Wd
[Wd]
[Wd++]
[Wd--]
[++Wd]
[--Wd]

Operands: Wd ∈ [W0 ... W15]
A ∈ [A,B]

Operation: If (Z = 0) execute as a NOP
Else
If (MINZ A) Then
  If (ACCA – ACCB < 0 Then
    (0xFFFF → Wd or ACCA – ACCB → Wd (see text);
    ACCB → ACCA;
    0 → Z; 1 → N; 0 → OV;)
  Else
    (0 → Wd;
    1 → Z; 0 → N; 0 → OV;)
If (MINZ B) Then
  If ACCB – ACCA < 0 Then
    (0xFFFF → Wd or ACCB – ACCA → Wd (see text);
    ACCA → ACCB;
    0 → Z; 1 → N; 0 → OV;)
  Else
    (0 → Wd;
    1 → Z; 0 → N; 0 → OV;)

Status Affected: N, OV, Z

Encoding:

1100	1110	A01x	x100	0qqq	dddd

MINZ.V

Accumulator Force Minimum Data Range Limit with Limit Excess Result (Conditional Execution)

Description:

If MINZ is executed when Z = 1 (see note), the target accumulator (defined in the instruction) is clamped to the minimum limit value previously loaded into the other accumulator. If MINZ is executed when Z = 0, the instruction is skipped (executed as a NOP).

The comparison examines the full 40-bit value of the target accumulator, and will therefore, clamp an overflowed accumulator.

If the target accumulator is less than the limit accumulator, load the target accumulator with the contents of the limit accumulator. For MINZ (instruction bit field xx = 2'b10), set Wd to -1. For MINZ.V (instruction bit field xx = 2'b11), write the (signed) value by which the limit is exceeded to Wd. This is sourced from the Least Significant 16 bits of the 40-bit result. If the limit is exceeded by a value greater than that which can be represented by a signed 16-bit number, saturate the Wd write to the maximum negative value (i.e., set Wd to 0x8000).

The Z and N Status bits are set such that a subsequent BRA LT instruction will take a branch if the limit is exceeded.

If the target accumulator is not less than the limit accumulator, the target accumulator is unaffected and Wd is cleared. The Z Status bit is set such that a subsequent BRA Z instruction will take a branch.

The OV Status bit is always cleared by this instruction.

The 'A' bit specifies the destination accumulator.
The 'd' bits select the address of the destination register.
The 'q' bits select the destination addressing mode.
The 'x' bits define the presence and result format for Wd.

Note 1: Execution of the MINZ.V instruction is intended to immediately follow execution of a MAX instruction. If MAX resulted in a clamp condition (Z = 0), the MINZ.V instruction will be skipped.

2: OA and SA or OB and SB Status bits are not modified by this instruction. Execute SFTAC <AccX>, #0 after MINZ.V execution to update DSP status to reflect the contents of AccX.

MOV

Move f to Destination

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax: {label:} MOV{.B} f {,WREG}

Operands: f ∈ [0 ... 8191]

Operation: (f) → destination designated by D

Status Affected: N, Z

Encoding:

1011	1111	1BDf	ffff	ffff	ffff

Description: Move the contents of the specified file register to the destination register. The optional WREG operand determines the destination register. If WREG is specified, the result is stored in WREG. If WREG is not specified, the result is stored back to the file register and the only effect is to modify the STATUS Register.

The 'B' bit selects byte or word operation ('0' for word, '1' for byte).
The 'D' bit selects the destination register ('0' for WREG, '1' for file register).
The 'f' bits select the address of the file register.

Note 1: The extension `.B` in the instruction denotes a byte operation rather than a word operation. You may use a `.W` extension to denote a word operation, but it is not required.

2: The WREG is set to Working register W0.

3: When moving word data from file register memory, the "`MOV f to Wnd`" (page 301) instruction allows any Working register (W0:W15) to be the destination register.

Words: 1

Cycles: 1(1)

Note 1: In dsPIC33E, dsPIC33C and PIC24E devices, the listed cycle count does not apply to read and Read-Modify-Write operations on non-CPU Special Function Registers. For more details, see **Note 3** in **Section 3.2.1 "Multicycle Instructions"**.

Example 1:

```
MOV.B  TMR0, WREG  ; move (TMR0) to WREG (Byte mode)
```

	Before Instruction		After Instruction
WREG (W0)	9080	WREG (W0)	9055
TMR0	2355	TMR0	2355
SR	0000	SR	0000

Example 2:

```
MOV    0x800       ; update SR based on (0x800) (Word mode)
```

	Before Instruction		After Instruction	
Data 0800	B29F	Data 0800	B29F	
SR	0000	SR	0008	(N = 1)

MOV

Move WREG to f

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax: {label:} MOV{.B} WREG, f

Operands: f ∈ [0 ... 8191]

Operation: (WREG) → f

Status Affected: None

Encoding:

1011	0111	1B1f	ffff	ffff	ffff

Description: Move the contents of the default Working register WREG into the specified file register.

The 'B' bit selects byte or word operation ('0' for word, '1' for byte).
The 'f' bits select the address of the file register.

Note 1: The extension `.B` in the instruction denotes a byte move rather than a word move. You may use a `.W` extension to denote a word move, but it is not required.

2: The WREG is set to Working register W0.

3: When moving word data from the Working register array to file register memory, the "`MOV Wns to f`" (page 302) instruction allows any Working register (W0:W15) to be the source register.

Words: 1

Cycles: 1

Example 1:

```
MOV.B  WREG, 0x801      ; move WREG to 0x801 (Byte mode)
```

	Before Instruction		After Instruction	
WREG (W0)	98F3	WREG (W0)	98F3	
Data 0800	4509	Data 0800	F309	
SR	0000	SR	0008	(N = 1)

Example 2:

```
MOV    WREG, DISICNT    ; move WREG to DISICNT
```

	Before Instruction		After Instruction
WREG (W0)	00A0	WREG (W0)	00A0
DISICNT	0000	DISICNT	00A0
SR	0000	SR	0000

MOV

Move f to Wnd

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax: {label:} MOV f, Wnd

Operands: f ∈ [0 ... 65534]
Wnd ∈ [W0 ... W15]

Operation: (f) → Wnd

Status Affected: None

Encoding:

1000	0fff	ffff	ffff	ffff	dddd

Description: Move the word contents of the specified file register to Wnd. The file register may reside anywhere in the 32K words of data memory, but must be word-aligned. Register Direct Addressing must be used for Wnd.

The 'f' bits select the address of the file register.
The 'd' bits select the destination register.

Note 1: This instruction operates on word operands only.

2: Since the file register address must be word-aligned, only the upper 15 bits of the file register address are encoded (bit 0 is assumed to be '0').

3: To move a byte of data from file register memory, the "`MOV f to Destination`" instruction (page 299) may be used.

Words: 1

Cycles: 1(1)

Note 1: In dsPIC33E, dsPIC33C and PIC24E devices, the listed cycle count does not apply to read and Read-Modify-Write operations on non-CPU Special Function Registers. For more details, see **Note 3** in **Section 3.2.1 "Multi-Cycle Instructions"**.

Example 1:

```
MOV   CORCON, W12     ; move CORCON to W12
```

	Before Instruction		After Instruction
W12	78FA	W12	00F0
CORCON	00F0	CORCON	00F0
SR	0000	SR	0000

Example 2:

```
MOV   0x27FE, W3      ; move (0x27FE) to W3
```

	Before Instruction		After Instruction
W3	0035	W3	ABCD
Data 27FE	ABCD	Data 27FE	ABCD
SR	0000	SR	0000

© 2005-2018 Microchip Technology Inc.

MOV

Move Wns to f

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax: {label:} MOV Wns, f

Operands: f ∈ [0 ... 65534]
Wns ∈ [W0 ... W15]

Operation: (Wns) → f

Status Affected: None

Encoding:

1000	1fff	ffff	ffff	ffff	ssss

Description: Move the word contents of the Working register Wns to the specified file register. The file register may reside anywhere in the 32K words of data memory, but must be word-aligned. Register Direct Addressing must be used for Wn.

The 'f' bits select the address of the file register.
The 's' bits select the source register.

Note 1: This instruction operates on word operands only.

2: Since the file register address must be word-aligned, only the upper 15 bits of the file register address are encoded (bit 0 is assumed to be '0').

3: To move a byte of data to file register memory, the "`MOV WREG to f`" instruction (page 300) may be used.

Words: 1

Cycles: 1

Example 1:

```
MOV   W4, XMDOSRT     ; move W4 to XMODSRT
```

	Before Instruction		After Instruction
W4	1200	W4	1200
XMODSRT	1340	XMODSRT	1200
SR	0000	SR	0000

Example 2:

```
MOV   W8, 0x1222      ; move W8 to data address 0x1222
```

	Before Instruction		After Instruction
W8	F200	W8	F200
Data 1222	FD88	Data 1222	F200

MOV.B

Move 8-Bit Literal to Wnd

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax: {label:} MOV.B #lit8, Wnd

Operands: lit8 ∈ [0 ... 255]
Wnd ∈ [W0 ... W15]

Operation: lit8 → Wnd

Status Affected: None

Encoding:

1011	0011	1100	kkkk	kkkk	dddd

Description: The unsigned 8-bit literal 'k' is loaded into the lower byte of Wnd. The upper byte of Wnd is not changed. Register Direct Addressing must be used for Wnd.

The 'k' bits specify the value of the literal.
The 'd' bits select the address of the Working register.

Note: This instruction operates in Byte mode and the `.B` extension must be provided.

Words: 1

Cycles: 1

Example 1:

```
MOV.B   #0x17, W5     ; load W5 with #0x17 (Byte mode)
```

	Before Instruction	After Instruction
W5	7899	7817
SR	0000	0000

Example 2:

```
MOV.B   #0xFE, W9     ; load W9 with #0xFE (Byte mode)
```

	Before Instruction	After Instruction
W9	AB23	ABFE
SR	0000	0000

© 2005-2018 Microchip Technology Inc.

MOV

Move 16-Bit Literal to Wnd

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax: {label:} MOV #lit16, Wnd

Operands: lit16 ∈ [-32768 ... 65535]
Wnd ∈ [W0 ... W15]

Operation: lit16 → Wnd

Status Affected: None

Encoding:

0010	kkkk	kkkk	kkkk	kkkk	dddd

Description: The 16-bit literal 'k' is loaded into Wnd. Register Direct Addressing must be used for Wnd.

The 'k' bits specify the value of the literal.
The 'd' bits select the address of the Working register.

Note 1: This instruction operates only in Word mode.

2: The literal may be specified as a signed value [-32768:32767] or unsigned value [0:65535].

Words: 1

Cycles: 1

Example 1:

```
MOV   #0x4231, W13     ; load W13 with #0x4231
```

	Before Instruction		After Instruction
W13	091B	W13	4231
SR	0000	SR	0000

Example 2:

```
MOV   #0x4, W2         ; load W2 with #0x4
```

	Before Instruction		After Instruction
W2	B004	W2	0004
SR	0000	SR	0000

Example 3:

```
MOV   #-1000, W8       ; load W8 with #-1000
```

	Before Instruction		After Instruction
W8	23FF	W8	FC18
SR	0000	SR	0000

© 2005-2018 Microchip Technology Inc.

MOV

Move [Ws with Offset] to Wnd

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax: {label:} MOV{.B} [Ws + Slit10], Wnd

Operands: Ws ∈ [W0 ... W15]
Slit10 ∈ [-512 ... 511] for byte operation
Slit10 ∈ [-1024 ... 1022] (even only) for word operation
Wnd ∈ [W0 ... W15]

Operation: [Ws + Slit10] → Wnd

Status Affected: None

Encoding:

1001	0kkk	kBkk	kddd	dkkk	ssss

Description: The contents of [Ws + Slit10] are loaded into Wnd. In Word mode, the range of Slit10 is increased to [-1024 ... 1022] and Slit10 must be even to maintain word address alignment. Register Indirect Addressing must be used for the source and Direct Addressing must be used for Wnd.

The 'k' bits specify the value of the literal.
The 'B' bit selects byte or word operation ('0' for word, '1' for byte).
The 'd' bits select the destination register.
The 's' bits select the source register.

Note 1: The extension `.B` in the instruction denotes a byte move rather than a word move. You may use a `.W` extension to denote a word move, but it is not required.

2: In Byte mode, the range of Slit10 is not reduced as specified in **Section 4.6 "Using 10-bit Literal Operands"**, since the literal represents an address offset from Ws.

Words: 1

Cycles: 1(1)

Note 1: In dsPIC33E, dsPIC33C and PIC24E devices, the listed cycle count does not apply to read and Read-Modify-Write operations on non-CPU Special Function Registers. For more details, see **Note 3** in **Section 3.2.1 "Multi-Cycle Instructions"**.

Example 1:

```
MOV.B    [W8+0x13], W10  ; load W10 with [W8+0x13]
                         ; (Byte mode)

MOV

Move Wns to [Wd with Offset]

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax: {label:} MOV{.B} Wns, [Wd + Slit10]

Operands: Wns ∈ [W0 ... W15]
Slit10 ∈ [-512 ... 511] in Byte mode
Slit10 ∈ [-1024 ... 1022] (even only) in Word mode
Wd ∈ [W0 ... W15]

Operation: (Wns) → [Wd + Slit10]

Status Affected: None

Encoding:

1001	1kkk	kBkk	kddd	dkkk	ssss

Description: The contents of Wns are stored to [Wd + Slit10]. In Word mode, the range of Slit10 is increased to [-1024 ... 1022] and Slit10 must be even to maintain word address alignment. Register Direct Addressing must be used for Wns and Indirect Addressing must be used for the destination.

The 'k' bits specify the value of the literal.
The 'B' bit selects byte or word operation ('0' for word, '1' for byte).
The 'd' bits select the destination register.
The 's' bits select the source register.

Note 1: The extension `.B` in the instruction denotes a byte move rather than a word move. You may use a `.W` extension to denote a word move, but it is not required.

2: In Byte mode, the range of Slit10 is not reduced as specified in **Section 4.6 "Using 10-bit Literal Operands"**, since the literal represents an address offset from Wd.

Words: 1

Cycles: 1

Example 1:

```
MOV.B  W0, [W1+0x7]       ; store W0 to [W1+0x7]
                          ; (Byte mode)

MOV

Move Ws to Wd

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax:	{label:}	MOV{.B}	Ws,	Wd
			[Ws],	[Wd]
			[Ws++],	[Wd++]
			[Ws--],	[Wd--]
			[--Ws],	[--Wd]
			[++Ws],	[++Wd]
			[Ws + Wb],	[Wd + Wb]

Operands: Ws ∈ [W0 ... W15]
Wb ∈ [W0 ... W15]
Wd ∈ [W0 ... W15]

Operation: (Ws) → Wd

Status Affected: None

Encoding:

0111	1www	wBhh	hddd	dggg	ssss

Description: Move the contents of the source register into the destination register. Either Register Direct or Indirect Addressing may be used for Ws and Wd.

The ‘w’ bits define the offset register Wb.
The ‘B’ bit selects byte or word operation (‘0’ for word, ‘1’ for byte).
The ‘h’ bits select the destination addressing mode.
The ‘d’ bits select the destination register.
The ‘g’ bits select the source addressing mode.
The ‘s’ bits select the source register.

Note 1: The extension `.B` in the instruction denotes a byte move rather than a word move. You may use a `.W` extension to denote a word move, but it is not required.

2: When Register Offset Addressing mode is used for both the source and destination, the offset must be the same because the ‘w’ encoding bits are shared by Ws and Wd.

3: The instruction, “`PUSH Ws`”, translates to “`MOV Ws, [W15++]`”.

4: The instruction, “`POP Wd`”, translates to “`MOV [--W15], Wd`”.

Words: 1

Cycles: 1(1)

Note 1: In dsPIC33E, dsPIC33C and PIC24E devices, the listed cycle count does not apply to read and Read-Modify-Write operations on non-CPU Special Function Registers. For more details, see **Note 3** in **Section 3.2.1 “Multi-Cycle Instructions”**.

MOV.D

Double-Word Move from Source to Wnd

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax: {label:} MOV.D Wns, Wnd
[Ws],
[Ws++],
[Ws--],
[++Ws],
[--Ws],

Operands: Wns ∈ [W0, W2, W4 ... W14]
Ws ∈ [W0 ... W15]
Wnd ∈ [W0, W2, W4 ... W14]

Operation: For Direct Addressing of Source:
Wns → Wnd
Wns + 1 → Wnd + 1
For Indirect Addressing of Source:
See Description

Status Affected: None

Encoding:

1011	1110	0000	0ddd	0ppp	ssss

Description: Move the double word specified by the source to a destination Working register pair (Wnd:Wnd + 1). If Register Direct Addressing is used for the source, the contents of two successive Working registers (Wns:Wns + 1) are moved to Wnd:Wnd + 1. If Indirect Addressing is used for the source, Ws specifies the Effective Address for the least significant word of the double word. Any pre/post-increment or pre/post-decrement will adjust Ws by 4 bytes to accommodate for the double word.

The ‘d’ bits select the destination register.
The ‘p’ bits select the source addressing mode.
The ‘s’ bits select the address of the first source register.

Note 1: This instruction only operates on double words. See Figure 4-3 for information on how double words are aligned in memory.
2: Wnd must be an even numbered Working register.
3: The instruction, “`POP.D Wnd`”, translates to “`MOV.D [--W15], Wnd`”.

Words: 1

Cycles: 2(1)

Note 1: In dsPIC33E, dsPIC33C and PIC24E devices, the listed cycle count does not apply to read and Read-Modify-Write operations on non-CPU Special Function Registers. For more details, see **Note 3** in **Section 3.2.1 “Multi-Cycle Instructions”**.

© 2005-2018 Microchip Technology Inc.

Example 1:

```

MOVPAG

Move Literal to Page Register

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
			X			X	X

Syntax: {label:} MOVPAG #lit10, DSRPAG
#lit9, DSWPAG
#lit8, TBLPAG

Operands: lit10 ∈ [0 ... 1023], lit9 ∈ [0 ... 511], lit8 ∈ [0 ... 255]

Operation: lit10 → DSRPAG or lit9 → DSWPAG or lit8 → TBLPAG

Status Affected: None

Encoding:

1111	1110	1100	PPkk	kkkk	kkkk

Description: The appropriate number of bits from the unsigned literal ‘k’ is loaded into the DSRPAG, DSWPAG or TBLPAG register. The assembler restricts the literal to a 9-bit unsigned value when the destination is DSWPAG and an 8-bit unsigned value when the destination is TBLPAG.

The ‘P’ bits select the destination register.
The ‘k’ bits specify the value of the literal.

Note: This instruction operates in Word mode only.

Words: 1

Cycles: 1

Example 1:

```
MOVPAG  #0x02, DSRPAG
```

	Before Instruction		After Instruction
DSRPAG	0000	DSRPAG	0002

MOVPAG

Move Wn to Page Register

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
			X			X	X

Syntax: {label:} MOVPAG Wn, DSRPAG
DSWPAG
TBLPAG

Operands: Wn ∈ [W0 ... W15]

Operation: Wn<9:0> → DSRPAG or Wn<8:0> → DSWPAG or Wn<7:0> → TBLPAG

Status Affected: None

Encoding:

1111	1110	1101	PP00	0000	ssss

Description: The appropriate number of bits from the register Ws is loaded into the DSRPAG, DSWPAG or TBLPAG register. The assembler restricts the literal to a 9-bit unsigned value when the destination is DSWPAG and an 8-bit unsigned value when the destination is TBLPAG.

The 'P' bits select the destination register.
The 's' bits specify the source register.

Note: This instruction operates in word mode only.

Words: 1

Cycles: 1

Example 1: `MOVPAG W2, DSRPAG`

	Before Instruction		After Instruction
DSRPAG	0000	DSRPAG	0002
W2	0002	W2	0002

MOVSAC

Prefetch Operands and Store Accumulator

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
				X	X	X	X

Syntax:	{label:}	MOVSAC	Acc	{,[Wx], Wxd}	{,[Wy], Wyd}	{,AWB}
				{,[Wx] + = kx, Wxd}	{,[Wy] + = ky, Wyd}	
				{,[Wx] – = kx, Wxd}	{,[Wy] – = ky, Wyd}	
				{,[W9 + W12], Wxd}	{,[W11 + W12], Wyd}	

Operands: Acc ∈ [A,B]
Wx ∈ [W8, W9]; kx ∈ [-6, -4, -2, 2, 4, 6]; Wxd ∈ [W4 ... W7]
Wy ∈ [W10, W11]; ky ∈ [-6, -4, -2, 2, 4, 6]; Wyd ∈ [W4 ... W7]
AWB ∈ [W13, [W13] + = 2]

Operation: ([Wx]) → Wxd; (Wx) + kx → Wx
([Wy]) → Wyd; (Wy) + ky → Wy
(Acc(B or A)) rounded → AWB

Status Affected: None

Encoding:

1100	0111	A0xx	yyii	iijj	jjaa

Description: Optionally prefetch operands in preparation for another MAC type instruction and optionally store the unspecified accumulator results. Even though an accumulator operation is not performed in this instruction, an accumulator must be specified to designate which accumulator to Write-Back.

Operands, Wx, Wxd, Wy and Wyd, specify optional prefetch operations, which support Indirect and Register Offset Addressing, as described in **Section 4.15.1 "MAC Prefetches"**. Operand AWB specifies the optional store of the "other" accumulator, as described in **Section 4.15.4 "MAC Write-Back"**.

The 'A' bit selects the other accumulator used for Write-Back.
The 'x' bits select the prefetch Wxd destination.
The 'y' bits select the prefetch Wyd destination.
The 'i' bits select the Wx prefetch operation.
The 'j' bits select the Wy prefetch operation.
The 'a' bits select the accumulator Write-Back destination.

Words: 1

Cycles: 1

Example 1:

```
MOVSAC  B, [W9], W6, [W11]+=4, W7, W13

MPY

Multiply Wm by Wn to Accumulator

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
				X	X	X	X

Syntax:	{label:}	MPY	Wm * Wn,	Acc	{,[Wx], Wxd}	{,[Wy], Wyd}
					{,[Wx] + = kx, Wxd}	{,[Wy] + = ky, Wyd}
					{,[Wx] – = kx, Wxd}	{,[Wy] – = ky, Wyd}
					{,[W9 + W12], Wxd}	{,[W11 + W12], Wyd}

Operands: Wm * Wn ∈ [W4 * W5, W4 * W6, W4 * W7, W5 * W6, W5 * W7, W6 * W7]
Acc ∈ [A,B]
Wx ∈ [W8, W9]; kx ∈ [-6, -4, -2, 2, 4, 6]; Wxd ∈ [W4 ... W7]
Wy ∈ [W10, W11]; ky ∈ [-6, -4, -2, 2, 4, 6]; Wyd ∈ [W4 ... W7]
AWB ∈ [W13], [W13] + = 2

Operation: (Wm) * (Wn) → Acc(A or B)
([Wx]) → Wxd; (Wx) + kx → Wx
([Wy]) → Wyd; (Wy) + ky → Wy

Status Affected: OA, OB, OAB, SA, SB, SAB

Encoding:

1100	0mmm	A0xx	yyii	iijj	jj11

Description: Multiply the contents of two Working registers and optionally prefetch operands in preparation for another MAC type instruction. The 32-bit result of the signed multiply is sign-extended to 40 bits and stored to the specified accumulator.

Operands, Wx, Wxd, Wy and Wyd, specify optional prefetch operations which support Indirect and Register Offset Addressing, as described in **Section 4.15.1 "MAC Prefetches"**.

The 'm' bits select the operand registers, Wm and Wn, for the multiply.
The 'A' bit selects the accumulator for the result.
The 'x' bits select the prefetch Wxd destination.
The 'y' bits select the prefetch Wyd destination.
The 'i' bits select the Wx prefetch operation.
The 'j' bits select the Wy prefetch operation.

Note 1: The IF bit (CORCON<0>) determines if the multiply is fractional or an integer.

2: The US<1:0> bits (CORCON<13:12> in dsPIC33E/dsPIC33C, CORCON<12> in dsPIC30F/dsPIC33F) determine if the multiply is unsigned, signed or mixed-sign. Only dsPIC33E/dsPIC33C devices support mixed-sign multiplication.

MSC

Multiply and Subtract from Accumulator

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
				X	X	X	X

Syntax: {label:} MSC Wm * Wn, Acc {,[Wx], Wxd} {,[Wy], Wyd} {,AWB}
{,[Wx] + = kx, Wxd} {,[Wy] + = ky, Wyd}
{,[Wx] – = kx, Wxd} {,[Wy] – = ky, Wyd}
{,[W9 + W12], Wxd} {,[W11 + W12], Wyd}

Operands:
Wm * Wn ∈ [W4 * W5, W4 * W6, W4 * W7, W5 * W6, W5 * W7, W6 * W7]
Acc ∈ [A,B]
Wx ∈ [W8, W9]; kx ∈ [-6, -4, -2, 2, 4, 6]; Wxd ∈ [W4 ... W7]
Wy ∈ [W10, W11]; ky ∈ [-6, -4, -2, 2, 4, 6]; Wyd ∈ [W4 ... W7]
AWB ∈ [W13, [W13] + = 2]

Operation:
(Acc(A or B)) – (Wm) * (Wn) → Acc(A or B)
([Wx]) → Wxd; (Wx) + kx → Wx
([Wy]) → Wyd; (Wy) + ky → Wy
(Acc(B or A)) rounded → AWB

Status Affected: OA, OB, OAB, SA, SB, SAB

Encoding:

1100	0mmm	A1xx	yyii	iijj	jjaa

Description:
Multiply the contents of two Working registers. Optionally prefetch operands in preparation for another MAC type instruction and optionally store the unspecified accumulator results. The 32-bit result of the signed multiply is sign-extended to 40 bits and subtracted from the specified accumulator.

Operands, Wx, Wxd, Wy and Wyd, specify optional prefetch operations, which support Indirect and Register Offset Addressing as described in **Section 4.15.1 "MAC Prefetches"**. Operand AWB specifies the optional store of the "other" accumulator as described in **Section 4.15.4 "MAC Write-Back"**.

The 'm' bits select the operand registers, Wm and Wn, for the multiply.
The 'A' bit selects the accumulator for the result.
The 'x' bits select the prefetch Wxd destination.
The 'y' bits select the prefetch Wyd destination.
The 'i' bits select the Wx prefetch operation.
The 'j' bits select the Wy prefetch operation.
The 'a' bits select the accumulator Write-Back destination.

MUL

Integer Unsigned Multiply f and WREG

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax: {label:} MUL{.B} f

Operands: f ∈ [0 ... 8191]

Operation:

For Byte Operation:
(WREG)<7:0> * (f)<7:0> → W2

For Word Operation:
(WREG) * (f) → W2:W3

Status Affected: None

Encoding:

1011	1100	0B0f	ffff	ffff	ffff

Description: Multiply the default Working register WREG with the specified file register and place the result in the W2:W3 register pair. Both operands and the result are interpreted as unsigned integers. If this instruction is executed in Byte mode, the 16-bit result is stored in W2. In Word mode, the most significant word of the 32-bit result is stored in W3 and the least significant word of the 32-bit result is stored in W2.

The 'B' bit selects byte or word operation ('0' for word, '1' for byte).
The 'f' bits select the address of the file register.

Note 1: The extension .B in the instruction denotes a byte operation rather than a word operation. You may use a .W extension to denote a word operation, but it is not required.

2: The WREG is set to Working register W0.

3: The IF bit (CORCON<0>) has no effect on this operation.

4: This is the only instruction which provides for an 8-bit multiply.

Words: 1

Cycles: 1(1)

Note 1: In dsPIC33E, dsPIC33C and PIC24E devices, the listed cycle count does not apply to read and Read-Modify-Write operations on non-CPU Special Function Registers. For more details, see **Note 3** in **Section 3.2.1 "Multi-Cycle Instructions"**.

MUL.SS

Integer 16x16-Bit Signed Multiply

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax: {label:} MUL.SS Wb, Ws, Wnd
[Ws],
[Ws++],
[Ws--],
[++Ws],
[--Ws],

Operands: Wb ∈ [W0 ... W15]
Ws ∈ [W0 ... W15]
Wnd ∈ [W0, W2, W4 ... W12]

Operation: signed (Wb) * signed (Ws) → Wnd:Wnd + 1

Status Affected: None

Encoding:

1011	1001	1www	wddd	dppp	ssss

Description: Multiply the contents of Wb with the contents of Ws and store the 32-bit result in two successive Working registers. The least significant word of the result is stored in Wnd (which must be an even numbered Working register) and the most significant word of the result is stored in Wnd + 1. Both source operands and the result Wnd are interpreted as two's complement signed integers. Register Direct Addressing must be used for Wb and Wnd. Register Direct or Register Indirect Addressing may be used for Ws.

The 'w' bits select the address of the base register.
The 'd' bits select the address of the lower destination register.
The 'p' bits select the source addressing mode.
The 's' bits select the source register.

Note 1: This instruction operates in Word mode only.

2: Since the product of the multiplication is 32 bits, Wnd must be an even Working register. See Figure 4-2 for information on how double words are aligned in memory.

3: Wnd may not be W14, since W15<0> is fixed to zero.

4: The IF bit and the US<1:0> bits in the CORCON register have no effect on this operation.

Words: 1

Cycles: 1(1)

Note 1: In dsPIC33E, dsPIC33C and PIC24E devices, the listed cycle count does not apply to read and Read-Modify-Write operations on non-CPU Special Function Registers. For more details, see **Note 3** in **Section 3.2.1 "Multi-Cycle Instructions"**.

Example 1:

```
MUL.SS  W0, W1, W12     ; Multiply W0*W1
                        ; Store the result to W12:W13
```

	Before Instruction		After Instruction

MUL.SS

Integer 16x16-Bit Signed Multiply with Accumulator Destination

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
						X	X

Syntax: {label:} MUL.SS Wb, Ws, Acc
[Ws],
[Ws++],
[Ws--],
[++Ws],
[--Ws],

Operands: Wb ∈ [W0 ... W15]
Ws ∈ [W0 ... W15]
Acc ∈ [A, B]

Operation: signed (Wb) * signed (Ws) → Acc(A or B)

Status Affected: None

Encoding:

1011	1001	1www	w111	Appp	ssss

Description: Performs a 16-bit x 16-bit signed multiply with a 32-bit result, which is stored in one of the DSP engine accumulators: ACCA or ACCB. The 32-bit result is sign-extended to bit 39 prior to being loaded into the target accumulator.

The source operands are treated as integer or fractional values depending upon the operating mode of the DSP engine (as defined by the IF bit in CORCON<0>). Both source operands are treated as signed values.

The 'w' bits select the address of the base register.
The 'p' bits select Source Addressing Mode 2.
The 'A' bit selects the destination accumulator for the product.

Note 1: This instruction operates in Word mode only.
2: The state of the Multiplier mode bits (US<1:0> in CORCON) has no effect upon the operation of this instruction.

Words: 1

Cycles: 1(1)

Note 1: In dsPIC33E, dsPIC33C and PIC24E devices, the listed cycle count does not apply to read and Read-Modify-Write operations on non-CPU Special Function Registers. For more details, see **Note 3** in **Section 3.2.1 "Multi-Cycle Instructions"**.

MUL.SU

Integer 16x16-Bit Signed-Unsigned Short Literal Multiply

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax: {label:} MUL.SU Wb, #lit5, Wnd

Operands: Wb ∈ [W0 ... W15]
lit5 ∈ [0 ... 31]
Wnd ∈ [W0, W2, W4 ... W12]

Operation: signed (Wb) * unsigned lit5 → Wnd:Wnd + 1

Status Affected: None

Encoding:

1011	1001	0www	wddd	d11k	kkkk

Description: Multiply the contents of Wb with the 5-bit literal and store the 32-bit result in two successive Working registers. The least significant word of the result is stored in Wnd (which must be an even numbered Working register) and the most significant word of the result is stored in Wnd + 1. The Wb operand and the result Wnd are interpreted as a two's complement signed integer. The literal is interpreted as an unsigned integer. Register Direct Addressing must be used for Wb and Wnd.

The 'w' bits select the address of the base register.
The 'd' bits select the address of the lower destination register.
The 'k' bits define a 5-bit unsigned integer literal.

Note 1: This instruction operates in Word mode only.

2: Since the product of the multiplication is 32 bits, Wnd must be an even numbered Working register. See Figure 4-3 for information on how double words are aligned in memory.

3: Wnd may not be W14, since W15<0> is fixed to zero.

4: The IF bit and the US<1:0> bits in the CORCON register have no effect on this operation.

Words: 1

Cycles: 1

Example 1:

```
MUL.SU  W0, #0x1F, W2  ; Multiply W0 by literal 0x1F
                       ; Store the result to W2:W3
```

MUL.UU

Integer 16x16-Bit Unsigned Short Literal Multiply

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax: {label:} MUL.UU Wb, #lit5, Wnd

Operands: Wb ∈ [W0 ... W15]
lit5 ∈ [0 ... 31]
Wnd ∈ [W0, W2, W4 ... W12]

Operation: unsigned (Wb) * unsigned lit5 → Wnd:Wnd + 1

Status Affected: None

Encoding:

1011	1000	0www	wddd	d11k	kkkk

Description: Multiply the contents of Wb with the 5-bit literal and store the 32-bit result in two successive Working registers. The least significant word of the result is stored in Wnd (which must be an even numbered Working register) and the most significant word of the result is stored in Wnd + 1. Both operands and the result are interpreted as unsigned integers. Register Direct Addressing must be used for Wb and Wnd.

The 'w' bits select the address of the base register.
The 'd' bits select the address of the lower destination register.
The 'k' bits define a 5-bit unsigned integer literal.

Note 1: This instruction operates in Word mode only.

2: Since the product of the multiplication is 32 bits, Wnd must be an even Working register. See Figure 4-3 for information on how double words are aligned in memory.

3: Wnd may not be W14, since W15<0> is fixed to zero.

4: The IF bit and the US<1:0> bits in the CORCON register have no effect on this operation.

			[Ws++],	
			[Ws--],	
			[++Ws],	
			[--Ws],	

Operands:
Wb ∈ [W0 ... W15]
Ws ∈ [W0 ... W15]
Wnd ∈ [W0, W2, W4 ... W12]

Operation: unsigned (Wb) * unsigned (Ws) → Wnd:Wnd + 1

Status Affected: None

Encoding:

1011	1000	0www	wddd	dppp	ssss

Description: Multiply the contents of Wb with the contents of Ws and store the 32-bit result in two successive Working registers. The least significant word of the result is stored in Wnd (which must be an even numbered Working register) and the most significant word of the result is stored in Wnd + 1. Both source operands and the result are interpreted as unsigned integers. Register Direct Addressing must be used for Wb and Wnd. Register Direct or Indirect Addressing may be used for Ws.

The ‘w’ bits select the address of the base register.
The ‘d’ bits select the address of the lower destination register.
The ‘p’ bits select the source addressing mode.
The ‘s’ bits select the source register.

Note 1: This instruction operates in Word mode only.

2: Since the product of the multiplication is 32 bits, Wnd must be an even numbered Working register. See Figure 4-3 for information on how double words are aligned in memory.

3: Wnd may not be W14, since W15<0> is fixed to zero.

4: The IF bit and the US<1:0> bits in the CORCON register have no effect on this operation.

Words: 1

Cycles: 1(1)

Note 1: In dsPIC33E, dsPIC33C and PIC24E devices, the listed cycle count does not apply to read and Read-Modify-Write operations on non-CPU Special Function Registers. For more details, see **Note 3** in **Section 3.2.1 “Multi-Cycle Instructions”**.

MUL.UU

Integer 16x16-Bit Unsigned Multiply with Accumulator Destination

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
						X	X

Syntax:

{label:}	MUL.UU	Wb,	Ws,	Acc
			[Ws],	
			[Ws++],	
			[Ws--],	
			[++Ws],	
			[--Ws],	

Operands:

Wb ∈ [W0 ... W15]
Ws ∈ [W0 ... W15]
Acc ∈ [A, B]

Operation: unsigned (Wb) * unsigned (Ws) → Acc(A or B)

Status Affected: None

Encoding:

1011	1000	0www	w111	Appp	ssss

Description:

Performs a 16-bit x 16-bit unsigned multiply with a 32-bit result, which is stored in one of the DSP engine accumulators: ACCA or ACCB. The 32-bit result is zero-extended to bit 39 prior to being loaded into the target accumulator.

The source operands are treated as integer or fractional values depending upon the operating mode of the DSP engine (as defined by the IF bit in CORCON<0>). Both source operands are treated as unsigned values.

The 'w' bits select the address of the base register.
The 'p' bits select Source Addressing Mode 2.
The 'A' bit selects the destination accumulator for the product.

Note 1: This instruction operates in Word mode only.

2: The state of the Multiplier mode bits (US<1:0> in CORCON) has no effect upon the operation of this instruction.

Words: 1

Cycles: 1(1)

Note 1: In dsPIC33E, dsPIC33C and PIC24E devices, the listed cycle count does not apply to read and Read-Modify-Write operations on non-CPU Special Function Registers. For more details, see **Note 3** in **Section 3.2.1 "Multi-Cycle Instructions"**.

Example 1: `MUL.UU W4, W0, B`

MUL.UU

Integer 16x16-Bit Unsigned Short Literal Multiply with Accumulator Destination

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
						X	X

Syntax: {label:} MUL.UU Wb, #lit5, Acc

Operands: Wb ∈ [W0 ... W15]
lit5 ∈ [0 ... 31]
Acc ∈ [A, B]

Operation: unsigned (Wb) * unsigned (lit5) → Acc(A or B)

Status Affected: None

Encoding:

1011	1000	0www	w111	A11k	kkkk

Description: Performs a 16-bit x 16-bit signed multiply with a 32-bit result, which is stored in one of the DSP engine accumulators: ACCA or ACCB. The 32-bit result is zero-extended to bit 39 prior to being loaded into the target accumulator.

The source operands are treated as integer or fractional values depending upon the operating mode of the DSP engine (as defined by the IF bit in CORCON<0>). Both source operands are treated as unsigned values.

The 'w' bits select the address of the base register.
The 'k' bits select the 5-bit literal.
The 'A' bit selects the destination accumulator for the product.

Note 1: This instruction operates in Word mode only.

2: The state of the Multiplier mode bits (US<1:0> in CORCON) has no effect upon the operation of this instruction.

Words: 1

MULW.SS

Integer 16x16-Bit Signed Multiply with 16-Bit Result

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
			X			X	X

Syntax: {label:} MULW.SS Wb, Ws, Wnd
[Ws],
[Ws++],
[Ws--],
[++Ws],
[--Ws],

Operands: Wb ∈ [W0 ... W15]
Ws ∈ [W0 ... W15]
Wnd ∈ [W0, W2, W4 ... W12]

Operation: signed (Wb) * signed (Ws) → Wnd

Status Affected: None

Encoding:

1011	1001	1www	wddd	dppp	ssss

Description: Multiply the contents of Wb with the contents of Ws and store the result in a Working register, which must be an even numbered Working register. Both source operands and the result Wnd are interpreted as two's complement signed integers. Register Direct Addressing must be used for Wb and Wnd. Register Direct or Register Indirect Addressing may be used for Ws.

The 'w' bits select the address of the base register.
The 'd' bits select the address of the lower destination register.
The 'p' bits select the source addressing mode.
The 's' bits select the source register.

Note 1: This instruction operates in Word mode only.
2: Wnd must be an even numbered Working register.
3: Wnd may not be W14, since W15<0> is fixed to zero.
4: The IF bit and the US<1:0> bits in the CORCON register have no effect on this operation.

Words: 1

Cycles: 1(1)

Note 1: In dsPIC33E, dsPIC33C and PIC24E devices, the listed cycle count does not apply to read and Read-Modify-Write operations on non-CPU Special Function Registers. For more details, see **Note 3** in **Section 3.2.1 "Multi-Cycle Instructions"**.

NEG

Negate f

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax: {label:} NEG{.B} f {,WREG}

Operands: f ∈ [0 ... 8191]

Operation: $\overline{(f)} + 1 \rightarrow$ destination designated by D

Status Affected: DC, N, OV, Z, C

Encoding:

1110	1110	0BDf	ffff	ffff	ffff

Description: Compute the two's complement of the contents of the file register and place the result in the destination register. The optional WREG operand determines the destination register. If WREG is specified, the result is stored in WREG. If WREG is not specified, the result is stored in the file register.

The 'B' bit selects byte or word operation ('0' for word, '1' for byte).
The 'D' bit selects the destination register ('0' for WREG, '1' for file register).
The 'f' bits select the address of the file register.

Note 1: The extension .B in the instruction denotes a byte operation rather than a word operation. You may use a .W extension to denote a word operation, but it is not required.

2: The WREG is set to Working register W0.

Words: 1

Cycles: 1(1)

Note 1: In dsPIC33E, dsPIC33C and PIC24E devices, the listed cycle count does not apply to read and Read-Modify-Write operations on non-CPU Special Function Registers. For more details, see **Note 3** in **Section 3.2.1 "Multicycle Instructions"**.

Example 1:

```
NEG.B  0x880, WREG     ; Negate (0x880) (Byte mode)
                       ; Store result to WREG

NEG

Negate Ws

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax:	{label:}	NEG{.B}	Ws,	Wd
			[Ws],	[Wd]
			[Ws++],	[Wd++]
			[Ws--],	[Wd--]
			[++Ws],	[++Wd]
			[--Ws],	[--Wd]

Operands: Ws ∈ [W0 ... W15]
Wd ∈ [W0 ... W15]

Operation: $\overline{(Ws)} + 1 \rightarrow Wd$

Status Affected: DC, N, OV, Z, C

Encoding:

1110	1010	0Bqq	qddd	dppp	ssss

Description: Compute the two's complement of the contents of the source register Ws and place the result in the destination register Wd. Either Register Direct or Indirect Addressing may be used for both Ws and Wd.

The 'B' bit selects byte or word operation ('0' for word, '1' for byte).
The 'q' bits select the destination addressing mode.
The 'd' bits select the destination register.
The 'p' bits select the source addressing mode.
The 's' bits select the source register.

Note: The extension .B in the instruction denotes a byte operation rather than a word operation. You may use a .W extension to denote a word operation, but it is not required.

Words: 1

Cycles: 1[(1)]

Note 1: In dsPIC33E, dsPIC33C and PIC24E devices, the listed cycle count does not apply to read and Read-Modify-Write operations on non-CPU Special Function Registers. For more details, see **Note 3** in **Section 3.2.1 "Multicycle Instructions"**.

Example 1:
```
NEG.B  W3, [W4++]      ; Negate W3 and store to [W4] (Byte mode)
                       ; Post-increment W4

NEG

Negate Accumulator

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
				X	X	X	X

Syntax: {label:} NEG Acc

Operands: Acc ∈ [A,B]

Operation: If (Acc = A):
-ACCA → ACCA
Else:
-ACCB → ACCB

Status Affected: OA, OB, OAB, SA, SB, SAB

Encoding:

1100	1011	A001	0000	0000	0000

Description: Compute the two's complement of the contents of the specified accumulator. Regardless of the Saturation mode, this instruction operates on all 40 bits of the accumulator.

The 'A' bit specifies the selected accumulator.

Words: 1

Cycles: 1

Example 1:

```
NEG  A      ; Negate ACCA
            ; Store result to ACCA
            ; CORCON = 0x0000 (no saturation)
```

	Before Instruction		After Instruction
ACCA	00 3290 59C8	ACCA	FF CD6F A638
CORCON	0000	CORCON	0000
SR	0000	SR	0000

Example 2:

```
NEG  B      ; Negate ACCB
            ; Store result to ACCB
            ; CORCON = 0x00C0 (normal saturation)
```

	Before Instruction		After Instruction
ACCB	FF F230 10DC	ACCB	00 0DCF EF24
CORCON	00C0	CORCON	00C0
SR	0000	SR	0000

NORM

Normalize Accumulator

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
							X

Syntax:

{label:}	NORM	Acc,	Wd
			[Wd]
			[Wd++]
			[Wd--]
			[++Wd]
			[--Wd]

Operands:
Wnd ∈ [W0 ... W15]
Acc ∈ [A,B]

Operation: Refer to text.

Status Affected: OA, SA *or* OB, SB, N, Z

Encoding:

1100	1110	A110	0000	0qqq	dddd

Description:

Normalize the contents of the target accumulator. If the accumulator contains an overflowed value, the contents of the accumulator are shifted right by the minimum number of bits required to remove the overflow. If the accumulator does not contain an overflowed value, the contents of the accumulator are shifted left by the minimum number of bits required to produce the largest fractional data value without an overflow.

If it is not possible to normalize the target accumulator (i.e., it is already normalized, or it is all '0's or all '1's), Wd is cleared, the Z bit is set and the N bit is cleared. The target accumulator is unaffected.

If it is possible to normalize the target accumulator, the exponent (shift value) required to normalize the target accumulator is written into Wd. A positive result indicates that a right shift of the accumulator was required for normalization. A negative result indicates that a left shift of the accumulator was required for normalization. The N bit is set to reflect the sign of the result and the Z bit is cleared.

The 'A' bit specifies the destination accumulator.
The 'd' bits select the address of the destination register.
The 'q' bits select Destination Address Mode 2.

Note 1: OA and SA or OB and SB Status bits are set based on the content of the target accumulator. Consequently, as the NORM instruction removes any overflow, OA or OB will always be cleared.

2: The SA/SB bits will remain set if they were already set prior to execution of the NORM instruction, but these bits can never be affected by this instruction.

Words: 1

Cycles: 1

POP

Pop TOS to f

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax: {label:} POP f

Operands: f ∈ [0 ... 65534]

Operation: (W15) – 2 → W15
(TOS) → f

Status Affected: None

Encoding:

1111	1001	ffff	ffff	ffff	fff0

Description: The Stack Pointer (W15) is pre-decremented by 2 and the Top-of-Stack (TOS) word is written to the specified file register, which may reside anywhere in the lower 32K words of data memory.

The 'f' bits select the address of the file register.

Note 1: This instruction operates in Word mode only.

2: The file register address must be word-aligned.

Words: 1

Cycles: 1

Example 1:

```
POP  0x1230    ; Pop TOS to 0x1230
```

POP

Pop TOS to Wd

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax: {label:} POP Wd
[Wd]
[Wd++]
[Wd--]
[--Wd]
[++Wd]
[Wd+Wb]

Operands: Wd ∈ [W0 ... W15]
Wb ∈ [W0 ... W15]

Operation: (W15) – 2 → W15
(TOS) → Wd

Status Affected: None

Encoding:

0111	1www	w0hh	hddd	d100	1111

Description: The Stack Pointer (W15) is pre-decremented by 2 and the Top-of-Stack (TOS) word is written to Wd. Either Register Direct or Indirect Addressing may be used for Wd.

The 'w' bits define the offset register Wb.
The 'h' bits select the destination addressing mode.
The 'd' bits select the destination register.

Note 1: This instruction operates in Word mode only.

2: This instruction is a specific version of the "`MOV Ws, Wd`" instruction, (`MOV [--W15], Wd`); it reverse assembles as `MOV`.

Words: 1

Cycles: 1

Example 1:

```
POP  W4        ; Pop TOS to W4

POP.D

Double Pop TOS to Wnd:Wnd+1

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax: {label:} POP.D Wnd

Operands: Wnd ∈ [W0, W2, W4, ... W14]

Operation:
(W15) – 2 → W15
(TOS) → Wnd + 1
(W15) – 2 → W15
(TOS) → Wnd

Status Affected: None

Encoding:

1011	1110	0000	0ddd	0100	1111

Description: A double word is POPped from the Top-of-Stack (TOS) and stored to Wnd:Wnd + 1. The most significant word is stored to Wnd + 1 and the least significant word is stored to Wnd. Since a double word is POPped, the Stack Pointer (W15) gets decremented by 4.

The 'd' bits select the address of the destination register pair.

Note 1: This instruction operates on double words. See Figure 4-3 for information on how double words are aligned in memory.

2: Wnd must be an even numbered Working register.

3: This instruction is a specific version of the "`MOV.D Ws, Wnd`" instruction, (`MOV.D [--W15], Wnd`); it reverse assembles as `MOV.D`.

Words: 1

Cycles: 2

Example 1:

POP.S

Pop Shadow Registers

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax: {label:} POP.S

Operands: None

Operation: POP shadow registers.

Status Affected: DC, N, OV, Z, C

Encoding:

1111	1110	1000	0000	0000	0000

Description: The values in the shadow registers are copied into their respective primary registers. The following registers are affected: W0-W3, and the C, Z, OV, N and DC STATUS Register flags.

Note 1: The shadow registers are not directly accessible. They may only be accessed with `PUSH.S` and `POP.S`.

2: The shadow registers are only one-level deep.

Words: 1

Cycles: 1

Example 1:

```
POP.S     ; Pop the shadow registers
          ; (See PUSH.S Example 1 for contents of shadows)
```

	Before Instruction		After Instruction	
W0	07BB		0000	
W1	03FD		1000	
W2	9610		2000	
W3	7249		3000	
SR	00E0	(IPL = 7)	00E1	(IPL = 7, C = 1)

Note: After instruction execution, the contents of shadow registers are NOT modified.

PUSH

Push f to TOS

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax: {label:} PUSH f

Operands: f ∈ [0 ... 65534]

Operation: (f) → (TOS)
(W15) + 2 → W15

Status Affected: None

Encoding:

1111	1000	ffff	ffff	ffff	fff0

Description: The contents of the specified file register are written to the Top-of-Stack (TOS) location and then the Stack Pointer (W15) is incremented by 2.

The file register may reside anywhere in the lower 32K words of data memory.

The 'f' bits select the address of the file register.

Note 1: This instruction operates in Word mode only.
2: The file register address must be word-aligned.

Words: 1

Cycles: 1(1)

Note 1: In dsPIC33E, dsPIC33C and PIC24E devices, the listed cycle count does not apply to read and Read-Modify-Write operations on non-CPU Special Function Registers. For more details, see **Note 3** in **Section 3.2.1 "Multicycle Instructions"**.

Example 1:
```
PUSH  0x2004        ; Push (0x2004) to TOS
```

	Before Instruction		After Instruction
W15	0B00	W15	0B02

SR	0000	SR	0000

PUSH

Push Ws to TOS

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax: {label:} PUSH Ws
[Ws]
[Ws++]
[Ws--]
[--Ws]
[++Ws]
[Ws+Wb]

Operands: Ws ∈ [W0 ... W15]
Wb ∈ [W0 ... W15]

Operation: (Ws) → (TOS)
(W15) + 2 → W15

Status Affected: None

Encoding:

0111	1www	w001	1111	1ggg	ssss

Description: The contents of Ws are written to the Top-of-Stack (TOS) location and then the Stack Pointer (W15) is incremented by 2.

The 'w' bits define the offset register Wb.
The 'g' bits select the source addressing mode.
The 's' bits select the source register.

Note 1: This instruction operates in Word mode only.

2: This instruction is a specific version of the "`MOV Ws, Wd`" instruction, (`MOV Ws, [W15++]`); it reverse assembles as `MOV`.

Words: 1

Cycles: 1[(1)]

Note 1: In dsPIC33E, dsPIC33C and PIC24E devices, the listed cycle count does not apply to read and Read-Modify-Write operations on non-CPU Special Function Registers. For more details, see **Note 3** in **Section 3.2.1 "Multicycle Instructions"**.

PUSH.D

Double Push Wns:Wns+1 to TOS

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax: {label:} PUSH.D Wns

Operands: Wns ∈ [W0, W2, W4 ... W14]

Operation: (Wns) → (TOS)
(W15) + 2 → W15
(Wns + 1) → (TOS)
(W15) + 2 → W15

Status Affected: None

Encoding:

1011	1110	1001	1111	1000	sss0

Description: A double word (Wns:Wns + 1) is PUSHed to the Top-of-Stack (TOS). The least significant word (Wns) is PUSHed to the TOS first and the most significant word (Wns + 1) is PUSHed to the TOS last. Since a double word is PUSHed, the Stack Pointer (W15) gets incremented by 4.

The 's' bits select the address of the source register pair.

Note 1: This instruction operates on double words. See Figure 4-3 for information on how double words are aligned in memory.

2: Wns must be an even numbered Working register.

3: This instruction is a specific version of the "`MOV.D Wns, Wd`" instruction, (`MOV.D Wns, [W15++]`); it reverse assembles as `MOV.D`.

PUSH.S

Push Shadow Registers

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax: {label:} PUSH.S

Operands: None

Operation: Push shadow registers.

Status Affected: None

Encoding:

1111	1110	1010	0000	0000	0000

Description: The contents of the primary registers are copied into their respective shadow registers. The following registers are shadowed: W0-W3, and the C, Z, OV, N and DC STATUS Register flags.

Note 1: The shadow registers are not directly accessible. They may only be accessed with PUSH.S and POP.S.

2: The shadow registers are only one-level deep.

Words: 1

Cycles: 1

Example 1:

```
PUSH.S    ; Push primary registers into shadow registers
```

	Before Instruction		After Instruction	
W0	0000		0000

PWRSAV

Enter Power-Saving Mode

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax: {label:} PWRSAV #lit1

Operands: lit1 ∈ [0,1]

Operation: 0 → WDT Count register
0 → WDT Prescaler A count
0 → WDT Prescaler B count
0 → WDTO (RCON<4>)
0 → SLEEP (RCON<3>)
0 → IDLE (RCON<2>)
If (lit1 = 0):
Enter Sleep mode
Else:
Enter Idle mode

Status Affected: None

Encoding:

1111	1110	0100	0000	0000	000k

Description: Place the processor into the specified power-saving mode. If lit1 = 0, Sleep mode is entered. In Sleep mode, the clock to the CPU and peripherals is shut down. If an on-chip oscillator is being used, it is also shut down. If lit1 = 1, Idle mode is entered. In Idle mode, the clock to the CPU shuts down, but the clock source remains active and the peripherals continue to operate.

This instruction resets the Watchdog Timer Count register and the Prescaler Count registers. In addition, the WDTO, SLEEP and IDLE flags of the Reset System and Control register (RCON) are reset.

Note 1: The processor will exit from Idle or Sleep through an interrupt, processor Reset or Watchdog Timer time-out. See the specific device data sheet for details.

2: If awakened from Idle mode, the IDLE bit (RCON<2>) is set to '1' and the clock source is applied to the CPU.

3: If awakened from Sleep mode, the SLEEP bit (RCON<3>) is set to '1' and the clock source is started.

4: If awakened from a Watchdog Timer time-out, the WDTO bit (RCON<4>) is set to '1'.

Words: 1

RCALL

Relative Call

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X		X	X		

Syntax: {label:} RCALL Expr

Operands: Expr may be an absolute address, label or expression.
Expr is resolved by the linker to a Slit16, where Slit16 ∈ [-32768 ... 32767].

Operation: (PC) + 2 → PC
(PC<15:0>) → (TOS)
(W15) + 2 → W15
(PC<22:16>) → (TOS)
(W15) + 2 → W15
(PC) + (2 * Slit16) → PC
NOP → Instruction Register

Status Affected: None

Encoding:

0000	0111	nnnn	nnnn	nnnn	nnnn

Description: Relative subroutine call with a range of 32K program words forward or backward from the current PC. Before the call is made, the return address (PC + 2) is PUSHed onto the stack. After the return address is stacked, the sign-extended 17-bit value (2 * Slit16) is added to the contents of the PC and the result is stored in the PC.

The 'n' bits are a signed literal that specifies the size of the relative call (in program words) from (PC + 2).

Note: When possible, this instruction should be used instead of CALL, since it only consumes one word of program memory.

Words: 1

Cycles: 2

Syntax: {label:} RCALL Expr

Operands: Expr may be an absolute address, label or expression.
Expr is resolved by the linker to a Slit16, where Slit16 ∈ [-32768 ... 32767].

Operation: (PC) + 2 → PC
(PC<15:1>) → TOS<15:1>, SFA Status bit → TOS<0>
(W15) + 2 → W15
(PC<22:16>) → (TOS)
(W15) + 2 → W15
0 → SFA Status bit
(PC) + (2 * Slit16) → PC
NOP → Instruction Register

Status Affected: SFA

Encoding:

0000	0111	nnnn	nnnn	nnnn	nnnn

Description: Relative subroutine call with a range of 32K program words forward or backward from the current PC. Before the call is made, the return address (PC + 2) is PUSHed onto the stack. After the return address is stacked, the sign-extended 17-bit value (2 * Slit16) is added to the contents of the PC and the result is stored in the PC.

The 'n' bits are a signed literal that specifies the size of the relative call (in program words) from (PC + 2).

Note: When possible, this instruction should be used instead of CALL, since it only consumes one word of program memory.

Words: 1

Cycles: 4

RCALL

Computed Relative Call

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X		X	X		

Syntax: {label:} RCALL Wn

Operands: Wn ∈ [W0 ... W15]

Operation:
(PC) + 2 → PC
(PC<15:0>) → (TOS)
(W15) + 2 → W15
(PC<22:16>) → (TOS)
(W15) + 2 → W15
(PC) + (2 * (Wn)) → PC
NOP → Instruction Register

Status Affected: None

Encoding:

0000	0001	0010	0000	0000	ssss

Description: Computed, relative subroutine call specified by the Working register Wn. The range of the call is 32K program words forward or backward from the current PC. Before the call is made, the return address (PC + 2) is PUSHed onto the stack. After the return address is stacked, the sign-extended 17-bit value (2 * (Wn)) is added to the contents of the PC and the result is stored in the PC. Register Direct Addressing must be used for Wn.

The 's' bits select the source register.

REPEAT

Repeat Next Instruction 'lit14+1' Times

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X		X	X		

Syntax: {label:} REPEAT #lit14

Operands: lit14 ∈ [0 ... 16383]

Operation: (lit14) → RCOUNT
(PC) + 2 → PC
Enable code looping.

Status Affected: RA

Encoding:

0000	1001	00kk	kkkk	kkkk	kkkk

Description: Repeat the instruction immediately following the REPEAT instruction (lit14 + 1) times. The repeated instruction (or target instruction) is held in the Instruction Register (IR) for all iterations and is only fetched once.

When this instruction executes, the RCOUNT register is loaded with the repeat count value specified in the instruction. RCOUNT is decremented with each execution of the target instruction. When RCOUNT equals zero, the target instruction is executed one more time and then normal instruction execution continues with the instruction following the target instruction.

The 'k' bits are an unsigned literal that specifies the loop count.

Special Features, Restrictions:

1. When the repeat literal is '0', REPEAT has the effect of a NOP and the RA bit is not set.
2. The target REPEAT instruction cannot be:
   - An instruction that changes program flow
   - A DO, DISI, LNK, MOV.D, PWRSAV, REPEAT or UNLK instruction
   - A 2-word instruction

   Unexpected results may occur if these target instructions are used.

Note: The REPEAT and target instruction are interruptible.

Words: 1

Cycles: 1

Example 1:

```
000452  REPEAT     #9                  ; Execute ADD 10 times
000454  ADD        [W0++], W1, [W2++]  ; Vector update
```

REPEAT

Repeat Next Instruction 'lit15+1' Times

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
			X			X	X

Syntax: {label:} REPEAT #lit15

Operands: lit15 ∈ [0 ... 32767]

Operation: (lit15) → RCOUNT
(PC) + 2 → PC
Enable code looping.

Status Affected: RA

Encoding:

0000	1001	0kkk	kkkk	kkkk	kkkk

Description: Repeat the instruction immediately following the REPEAT instruction (lit15 + 1) times. The repeated instruction (or target instruction) is held in the Instruction Register for all iterations and is only fetched once.

When this instruction executes, the RCOUNT register is loaded with the repeat count value specified in the instruction. RCOUNT is decremented with each execution of the target instruction. When RCOUNT equals zero, the target instruction is executed one more time and then normal instruction execution continues with the instruction following the target instruction.

The 'k' bits are an unsigned literal that specifies the loop count.

Special Features, Restrictions:

1. When the repeat literal is '0', REPEAT has the effect of a NOP and the RA bit is not set.
2. The target REPEAT instruction cannot be:
   - An instruction that changes program flow
   - A DISI, LNK, MOV.D, PWRSAV, REPEAT or UNLK instruction
   - A 2-word instruction

   Unexpected results may occur if these target instructions are used.

Note: The REPEAT and target instruction are interruptible.

REPEAT

Repeat Next Instruction Wn+1 Times

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X		X	X		

Syntax: {label:} REPEAT Wn

Operands: Wn ∈ [W0 ... W15]

Operation: (Wn<13:0>) → RCOUNT
(PC) + 2 → PC
Enable code looping.

Status Affected: RA

Encoding:

0000	1001	1000	0000	0000	ssss

Description: Repeat the instruction immediately following the REPEAT instruction (Wn<13:0>) times. The instruction to be repeated (or target instruction) is held in the Instruction Register for all iterations and is only fetched once.

When this instruction executes, the RCOUNT register is loaded with the lower 14 bits of Wn. RCOUNT is decremented with each execution of the target instruction. When RCOUNT equals zero, the target instruction is executed one more time and then normal instruction execution continues with the instruction following the target instruction.

The 's' bits specify the Wn register that contains the repeat count.

Special Features, Restrictions:

1. When (Wn) = 0, REPEAT has the effect of a NOP and the RA bit is not set.
2. The target REPEAT instruction cannot be:
   - An instruction that changes program flow
   - A DO, DISI, LNK, MOV.D, PWRSAV, REPEAT or ULNK instruction
   - A 2-word instruction

   Unexpected results may occur if these target instructions are used.

Note: The REPEAT and target instruction are interruptible.

RESET

Reset

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax: {label:} RESET

Operands: None

Operation: Force all registers that are affected by a $\overline{\text{MCLR}}$ Reset to their Reset condition.
1 → SWR (RCON<6>)
0 → PC

Status Affected: OA, OB, OAB, SA, SB, SAB, DA, DC, IPL<2:0>, RA, N, OV, Z, C, SFA

Encoding:

1111	1110	0000	0000	0000	0000

Description: This instruction provides a way to execute a software Reset. All core and peripheral registers will take their power-on value. The PC will be set to '0', the location of the RESET GOTO instruction. The SWR bit (RCON<6>) will be set to '1' to indicate that the RESET instruction was executed.

Note: Refer to the specific device family reference manual for the power-on value of all registers.

Words: 1

Cycles: 1

Example 1:

```
00202A   RESET     ; Execute software RESET on dsPIC33F
```

RETFIE

Return from Interrupt

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X		X	X		

Syntax: {label:} RETFIE

Operands: None

Operation:
(W15) – 2 → W15
(TOS<15:8>) → (SR<7:0>)
(TOS<7>) → (IPL3, CORCON<3>)
(TOS<6:0>) → (PC<22:16>)
(W15) – 2 → W15
(TOS<15:0>) → (PC<15:0>)
NOP → Instruction Register

Status Affected: IPL<3:0>, RA, N, OV, Z, C

Encoding:

0000	0110	0100	0000	0000	0000

Description: Return from Interrupt Service Routine. The stack is POPped, which loads the low byte of the STATUS Register, IPL<3> (CORCON<3>) and the Most Significant Byte of the PC. The stack is POPped again, which loads the lower 16 bits of the PC.

Note 1: Restoring IPL<3> and the low byte of the STATUS Register restores the Interrupt Priority Level to the level before the execution was processed.

2: Before RETFIE is executed, the appropriate interrupt flag must be cleared in software to avoid recursive interrupts.

Words: 1

Cycles: 3 (2 if exception pending)

RETLW

Return with Literal in Wn

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X		X	X		

Syntax: {label:} RETLW{.B} #lit10, Wn

Operands:
lit10 ∈ [0 ... 255] for byte operation
lit10 ∈ [0 ... 1023] for word operation
Wn ∈ [W0 ... W15]

Operation:
(W15) – 2 → W15
TOS<15:8> → SR<7:0>
TOS<7:0> → IPL<3>: PC<22:16>
(W15) – 2 → W15
(TOS) → (PC<15:0>)
lit10 → Wn
NOP → Instruction Register

Status Affected: None

Encoding:

0000	0101	0Bkk	kkkk	kkkk	dddd

Description:
Return from subroutine with the specified, unsigned 10-bit literal stored in Wn. The software stack is POPped twice to restore the PC and the signed literal is stored in Wn. Since two POPs are made, the Stack Pointer (W15) is decremented by 4.

The 'B' bit selects byte or word operation ('0' for word, '1' for byte).
The 'k' bits specify the value of the literal.
The 'd' bits select the destination register.

Note 1: The extension .B in the instruction denotes a byte operation rather than a word operation. You may use a .W extension to denote a word operation, but it is not required.

2: For byte operations, the literal must be specified as an unsigned value [0:255]. See **Section 4.6 "Using 10-Bit Literal Operands"** for information on using 10-bit literal operands in Byte mode.

Words: 1

Cycles: 3 (2 if exception pending)

Example 1:

```
000440   RETLW.B #0xA, W0   ; Return with 0xA in W0
```

RLC

Rotate Left f through Carry

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax: {label:} RLC{.B} f {,WREG}

Operands: f ∈ [0 ... 8191]

Operation:

For Byte Operation:
(C) → Dest<0>
(f<6:0>) → Dest<7:1>
(f<7>) → C

For Word Operation:
(C) → Dest<0>
(f<14:0>) → Dest<15:1>
(f<15>) → C

Status Affected: N, Z, C

Encoding:

1101	0110	1BDf	ffff	ffff	ffff

Description: Rotate the contents of the file register f, one bit to the left through the Carry flag, and place the result in the destination register. The Carry flag of the STATUS Register is shifted into the Least Significant bit of the destination and it is then overwritten with the Most Significant bit of Ws.

The optional WREG operand determines the destination register. If WREG is specified, the result is stored in WREG. If WREG is not specified, the result is stored in the file register.

The 'B' bit selects byte or word operation ('0' for word, '1' for byte).
The 'D' bit selects the destination register ('0' for f, '1' for WREG).
The 'f' bits select the address of the file register.

Note 1: The extension `.B` in the instruction denotes a byte operation rather than a word operation. You may use a `.W` extension to denote a word operation, but it is not required.

2: The WREG is set to Working register W0.

Words: 1

Cycles: 1

Example 1:

```
RLC.B    0x1233         ; Rotate Left w/ C (0x1233) (Byte mode)
```

RLC

Rotate Left Ws through Carry

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax:

{label:}	RLC{.B}	Ws,	Wd
		[Ws],	[Wd]
		[Ws++],	[Wd++]
		[Ws--],	[Wd--]
		[++Ws],	[++Wd]
		[--Ws],	[--Wd]

Operands:

Ws ∈ [W0 ... W15]
Wd ∈ [W0 ... W15]

Operation:

For Byte Operation:
(C) → Wd<0>
(Ws<6:0>) → Wd<7:1>
(Ws<7>) → C

For Word Operation:
(C) → Wd<0>
(Ws<14:0>) → Wd<15:1>
(Ws<15>) → C

Status Affected: N, Z, C

Encoding:

1101	0010	1Bqq	qddd	dppp	ssss

Description:

Rotate the contents of the source register Ws, one bit to the left through the Carry flag, and place the result in the destination register Wd. The Carry flag of the STATUS Register is shifted into the Least Significant bit of Wd and it is then overwritten with the Most Significant bit of Ws. Either Register Direct or Indirect Addressing may be used for Ws and Wd.

The 'B' bit selects byte or word operation ('0' for word, '1' for byte).
The 'q' bits select the destination addressing mode.
The 'd' bits select the destination register.
The 'p' bits select the source addressing mode.
The 's' bits select the source register.

Note: The extension .B in the instruction denotes a byte operation rather than a word operation. You may use a .W extension to denote a word operation, but it is not required.

Words: 1

Cycles: 1

RLNC

Rotate Left f without Carry

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax: {label:} RLNC{.B} f {,WREG}

Operands: f ∈ [0 ... 8191]

Operation:

For Byte Operation:
(f<6:0>) → Dest<7:1>
(f<7>) → Dest<0>

For Word Operation:
(f<14:0>) → Dest<15:1>
(f<15>) → Dest<0>

Status Affected: N, Z

Encoding:

1101	0110	0BDf	ffff	ffff	ffff

Description: Rotate the contents of the file register f, one bit to the left, and place the result in the destination register. The Most Significant bit of f is stored in the Least Significant bit of the destination and the Carry flag is not affected.

The optional WREG operand determines the destination register. If WREG is specified, the result is stored in WREG. If WREG is not specified, the result is stored in the file register.

The 'B' bit selects byte or word operation ('0' for word, '1' for byte).
The 'D' bit selects the destination register ('0' for WREG, '1' for file register).
The 'f' bits select the address of the file register.

Note 1: The extension .B in the instruction denotes a byte operation rather than a word operation. You may use a .W extension to denote a word operation, but it is not required.

2: The WREG is set to Working register W0.

Words: 1

Cycles: 1(1)

Note 1: In dsPIC33E, dsPIC33C and PIC24E devices, the listed cycle count does not apply to read and Read-Modify-Write operations on non-CPU Special Function Registers. For more details, see **Note 3** in **Section 3.2.1 "Multicycle Instructions"**.

RRNC

Rotate Right f without Carry

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax: {label:} RRNC{.B} f {,WREG}

Operands: f ∈ [0 ... 8191]

Operation:

For Byte Operation:
(f<7:1>) → Dest<6:0>
(f<0>) → Dest<7>

For Word Operation:
(f<15:1>) → Dest<14:0>
(f<0>) → Dest<15>

Status Affected: N, Z

Encoding:

1101	0111	0BDf	ffff	ffff	ffff

Description: Rotate the contents of the file register f, one bit to the right, and place the result in the destination register. The Least Significant bit of f is stored in the Most Significant bit of the destination and the Carry flag is not affected.

The optional WREG operand determines the destination register. If WREG is specified, the result is stored in WREG. If WREG is not specified, the result is stored in the file register.

The 'B' bit selects byte or word operation ('0' for word, '1' for byte).
The 'D' bit selects the destination register ('0' for WREG, '1' for file register).
The 'f' bits select the address of the file register.

Note 1: The extension `.B` in the instruction denotes a byte operation rather than a word operation. You may use a `.W` extension to denote a word operation, but it is not required.

2: The WREG is set to Working register W0.

Words: 1

Cycles: 1(1)

Note 1: In dsPIC33E, dsPIC33C and PIC24E devices, the listed cycle count does not apply to read and Read-Modify-Write operations on non-CPU Special Function Registers. For more details, see **Note 3** in **Section 3.2.1 "Multicycle Instructions"**.

Example 1:

```
RRNC.B   0x1233          ; Rotate Right (0x1233) (Byte mode)
```

	Before Instruction	After Instruction
Data 1232	E807	7407
SR	0000	0000

Example 2:

```
RRNC     0x820, WREG     ; Rotate Right (0x820) (Word mode)
                         ; Store result in WREG
```

	Before Instruction		After Instruction	
WREG (W0)	5601		WREG (W0)	10B7
Data 0820	216E		Data 0820	216E
SR	0001	(C = 1)	SR	0001	(C = 1)

RRNC

Rotate Right Ws without Carry

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax:

{label:}	RRNC{.B}	Ws,	Wd
		[Ws],	[Wd]
		[Ws++],	[Wd++]
		[Ws--],	[Wd--]
		[++Ws],	[++Wd]
		[--Ws],	[--Wd]

Operands:

Ws ∈ [W0 ... W15]
Wd ∈ [W0 ... W15]

Operation:

For Byte Operation:
(Ws<7:1>) → Wd<6:0>
(Ws<0>) → Wd<7>

For Word Operation:
(Ws<15:1>) → Wd<14:0>
(Ws<0>) → Wd<15>

Status Affected: N, Z

Encoding:

1101	0011	0Bqq	qddd	dppp	ssss

Description:

Rotate the contents of the source register Ws, one bit to the right, and place the result in the destination register Wd. The Least Significant bit of Ws is stored in the Most Significant bit of Wd and the Carry flag is not affected. Either Register Direct or Indirect Addressing may be used for Ws and Wd.

The ‘B’ bit selects byte or word operation (‘0’ for word, ‘1’ for byte).
The ‘q’ bits select the destination addressing mode.
The ‘d’ bits select the destination register.
The ‘p’ bits select the source addressing mode.
The ‘s’ bits select the source register.

Note: The extension `.B` in the instruction denotes a byte operation rather than a word operation. You may use a `.W` extension to denote a word operation, but it is not required.

Words: 1

Cycles: 1(1)

Note 1: In dsPIC33E, dsPIC33C and PIC24E devices, the listed cycle count does not apply to read and Read-Modify-Write operations on non-CPU Special Function Registers. For more details, see **Note 3** in **Section 3.2.1 “Multicycle Instructions”**.

SAC

Store Accumulator

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
				X	X	X	X

Syntax:

{label:}	SAC	Acc,	{#Slit4,}	Wd
				[Wd]
				[Wd++]
				[Wd--]
				[--Wd]
				[++Wd]
				[Wd + Wb]

Operands:
Acc ∈ [A,B]
Slit4 ∈ [-8 ... +7]
Wb, Wd ∈ [W0 ... W15]

Operation:
$Shift_{Slit4}$(Acc) (optional)
(Acc[31:16]) → Wd

Status Affected:
None

Encoding:

1100	1100	Awww	wrrr	rhhh	dddd

Description:
Perform an optional, signed 4-bit shift of the specified accumulator, then store the shifted contents of ACCxH (Acc[31:16]) to Wd. The shift range is -8:7, where a negative operand indicates an arithmetic left shift and a positive operand indicates an arithmetic right shift. Either Register Direct or Indirect Addressing may be used for Wd.

The ‘A’ bit specifies the source accumulator.
The ‘w’ bits specify the offset register Wb.
The ‘r’ bits encode the optional accumulator preshift.
The ‘h’ bits select the destination addressing mode.
The ‘d’ bits specify the destination register Wd.

Note 1: This instruction does not modify the contents of Acc.

2: This instruction stores the truncated contents of Acc. The instruction, SAC.R, may be used to store the rounded accumulator contents.

3: If data write saturation is enabled (SATDW (CORCON<5>) = 1), the value stored to Wd is subject to saturation after the optional shift is performed.

Words: 1

Cycles: 1

Example 1:

```
SAC  A, #4, W5
; Right shift ACCA by 4
; Store result to W5
; CORCON = 0x0010 (SATDW = 1)
```

	Before Instruction	After Instruction
W5	B900	0120
ACCA	00 120F FF00	00 120F FF00
CORCON	0010	0010
SR	0000	0000

Example 2:

```
SAC  B, #-4, [W5++]
; Left shift ACCB by 4
; Store result to [W5], Post-increment W5
; CORCON = 0x0010 (SATDW = 1)
```

	Before Instruction	After Instruction
W5	2000	2002
ACCB	FF C891 8F4C	FF C891 1F4C
Data 2000	5BBE	8000
CORCON	0010	0010
SR	0000	0000

© 2005-2018 Microchip Technology Inc.

SAC.D

Store Accumulator Double

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
							X

Syntax:

{label:}	SAC.D	Acc,	[, #Slit4],	Wnd
				[Wnd]
				[Wnd++]
				[Wnd--]
				[--Wnd]
				[++Wnd]

Operands:
Register Direct: Wnd ∈ [W0, W2, W4, W6, W8, W10, W12, W14];
Register Indirect: Wnd ∈ [W0 ... W15];
Acc ∈ [A,B]
Slit4 ∈ [-8 ... +7]

Operation: $Shift_{Slit4}(Acc)$ (optional); (Acc[31:0]) → Wnd

Status Affected: None

Encoding:

1101	1100	A0qq	qrrr	r000	dddd

Description:
Optionally shift accumulator, then store accumulator, Acc<31:0>, to the destination Effective Address.

The ‘A’ bit specifies the source accumulator.
The ‘d’ bits specify the destination register Wnd.
The ‘q’ bits select the destination addressing mode.
The ‘r’ bits encode the optional operand Slit4, which determines the amount of the accumulator preshift; if the operand Slit4 is absent, a ‘0’ is encoded.

Note 1: Unlike SAC and SAC.R instructions, the SAC.D instruction does not support Indirect with Register Offset Addressing mode.

2: Positive values of operand Slit4 represent arithmetic shift right. Negative values of operand Slit4 represent shift left.

3: The SAC.D instruction cannot be executed within a REPEAT loop.

Words: 1

Cycles: 2

© 2005-2018 Microchip Technology Inc.

SAC.R

Store Rounded Accumulator

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
				X	X	X	X

Syntax:

{label:}	SAC.R	Acc,	{#Slit4,}	Wd
				[Wd]
				[Wd++]
				[Wd--]
				[--Wd]
				[++Wd]
				[Wd + Wb]

Operands:

Acc ∈ [A,B]
Slit4 ∈ [-8 ... +7]
Wb ∈ [W0 ... W15]
Wd ∈ [W0 ... W15]

Operation:

$Shift_{Slit4}$(Acc) (optional)
Round(Acc)
(Acc[31:16]) → Wd

Status Affected: None

Encoding:

1100	1101	Awww	wrrr	rhhh	dddd

Description:

Perform an optional, signed 4-bit shift of the specified accumulator, then store the rounded contents of ACCxH (Acc[31:16]) to Wd. The shift range is -8:7, where a negative operand indicates an arithmetic left shift and a positive operand indicates an arithmetic right shift. The Rounding mode (Conventional or Convergent) is set by the RND bit (CORCON<1>). Either Register Direct or Indirect Addressing may be used for Wd.

The 'A' bit specifies the source accumulator.
The 'w' bits specify the offset register Wb.
The 'r' bits encode the optional accumulator preshift.
The 'h' bits select the destination addressing mode.
The 'd' bits specify the destination register Wd.

Note 1: This instruction does not modify the contents of the Acc.

2: This instruction stores the rounded contents of Acc. The instruction, SAC, may be used to store the truncated accumulator contents.

3: If data write saturation is enabled (SATDW (CORCON<5>) = 1), the value stored to Wd is subject to saturation after the optional shift is performed.

Words: 1

Cycles: 1

SE

Sign-Extend Ws

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax: {label:} SE Ws, Wnd
[Ws],
[Ws++],
[Ws--],
[++Ws],
[--Ws],

Operands: Ws ∈ [W0 ... W15]
Wnd ∈ [W0 ... W15]

Operation: Ws<7:0> → Wnd<7:0>
If (Ws<7> = 1):
0xFF → Wnd<15:8>
Else:
0 → Wnd<15:8>

Status Affected: N, Z, C

Encoding:

1111	1011	0000	0ddd	dppp	ssss

Description: Sign-extend the byte in Ws and store the 16-bit result in Wnd. Either Register Direct or Indirect Addressing may be used for Ws and Register Direct Addressing must be used for Wnd. The C flag is set to the complement of the N flag.

The 'd' bits select the destination register.
The 'p' bits select the source addressing mode.
The 's' bits select the source register.

Note 1: This operation converts a byte to a word and it uses no `.B` or `.W` extension.

2: The source Ws is addressed as a byte operand, so any address modification is by '1'.

Words: 1

Cycles: 1(1)

Note 1: In dsPIC33E, dsPIC33C and PIC24E devices, the listed cycle count does not apply to read and Read-Modify-Write operations on non-CPU Special Function Registers. For more details, see **Note 3** in **Section 3.2.1 "Multicycle Instructions"**.

SETM

Set f or WREG

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax: {label:} SETM{.B} f
WREG

Operands: f ∈ [0 ... 8191]

Operation: For Byte Operation:
0xFF → destination designated by D
For Word Operation:
0xFFFF → destination designated by D

Status Affected: None

Encoding:

1110	1111	1BDf	ffff	ffff	ffff

Description: All the bits of the specified register are set to '1'. If WREG is specified, the bits of WREG are set. Otherwise, the bits of the specified file register are set.

The 'B' bit selects byte or word operation ('0' for word, '1' for byte).
The 'D' bit selects the destination register ('0' for WREG, '1' for file register).
The 'f' bits select the address of the file register.

Note 1: The extension .B in the instruction denotes a byte operation rather than a word operation. You may use a .W extension to denote a word operation, but it is not required.

2: The WREG is set to Working register W0.

SFTAC

Arithmetic Shift Accumulator by Slit6

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
				X	X	X	X

Syntax: {label:} SFTAC Acc, #Slit6

Operands: Acc ∈ [A,B]
Slit6 ∈ [-16 ... 16]

Operation: $Shift_k(Acc) \rightarrow Acc$

Status Affected: OA, OB, OAB, SA, SB, SAB

Encoding:

1100	1000	A000	0000	01kk	kkkk

Description: Arithmetic shift the 40-bit contents of the specified accumulator by the signed, 6-bit literal and store the result back into the accumulator. The shift range is -16:16, where a negative operand indicates a left shift and a positive operand indicates a right shift. Any bits which are shifted out of the accumulator are lost.

The 'A' bit selects the accumulator for the result.
The 'k' bits determine the number of bits to be shifted.

Note 1: If saturation is enabled for the target accumulator (SATA, CORCON<7> or SATB, CORCON<6>), the value stored to the accumulator is subject to saturation.

2: If the shift amount is greater than 16 or less than -16, no modification will be made to the accumulator and an arithmetic trap will occur.

Words: 1

Cycles: 1

Example 1:

```
SFTAC  A, #12
; Arithmetic right shift ACCA by 12
; Store result to ACCA
; CORCON = 0x0080 (SATA = 1)
```

SFTAC

Arithmetic Shift Accumulator by Wb

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
				X	X	X	X

Syntax: {label:} SFTAC Acc, Wb

Operands: Acc ∈ [A,B]
Wb ∈ [W0 ... W15]

Operation: $Shift_{(Wb)}(Acc) \rightarrow Acc$

Status Affected: OA, OB, OAB, SA, SB, SAB

Encoding:

1100	1000	A000	0000	0000	ssss

Description: Arithmetic shift the 40-bit contents of the specified accumulator and store the result back into the accumulator. The Least Significant 6 bits of Wb are used to specify the shift amount. The shift range is -16:16, where a negative value indicates a left shift and a positive value indicates a right shift. Any bits which are shifted out of the accumulator are lost.

The 'A' bit selects the accumulator for the source/destination.
The 's' bits select the address of the Shift Count register.

Note 1: If saturation is enabled for the target accumulator (SATA, CORCON<7> or SATB, CORCON<6>), the value stored to the accumulator is subject to saturation.

2: If the shift amount is greater than 16 or less than -16, no modification will be made to the accumulator and an arithmetic trap will occur.

Words: 1

Cycles: 1

Example 1:

```
SFTAC  A, W0

SL

Shift Left f

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax: {label:} SL{.B} f {,WREG}

Operands: f ∈ [0 ... 8191]

Operation:

For Byte Operation:
(f<7>) → (C)
(f<6:0>) → Dest<7:1>
0 → Dest<0>

For Word Operation:
(f<15>) → (C)
(f<14:0>) → Dest<15:1>
0 → Dest<0>

Status Affected: N, Z, C

Encoding:

1101	0100	0BDf	ffff	ffff	ffff

Description: Shift the contents of the file register, one bit to the left, and place the result in the destination register. The Most Significant bit of the file register is shifted into the Carry bit of the STATUS Register and '0' is shifted into the Least Significant bit of the destination register.

The optional WREG operand determines the destination register. If WREG is specified, the result is stored in WREG. If WREG is not specified, the result is stored in the file register.

The 'B' bit selects byte or word operation ('0' for word, '1' for byte).
The 'D' bit selects the destination register ('0' for WREG, '1' for file register).
The 'f' bits select the address of the file register.

Note 1: The extension .B in the instruction denotes a byte operation rather than a word operation. You may use a .W extension to denote a word operation, but it is not required.

2: The WREG is set to Working register W0.

Words: 1

Cycles: 1(1)

Note 1: In dsPIC33E, dsPIC33C and PIC24E devices, the listed cycle count does not apply to read and Read-Modify-Write operations on non-CPU Special Function Registers. For more details, see **Note 3** in **Section 3.2.1 "Multicycle Instructions"**.

© 2005-2018 Microchip Technology Inc.

SL

Shift Left Ws

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax:

{label:}	SL{.B}	Ws,	Wd
		[Ws],	[Wd]
		[Ws++],	[Wd++]
		[Ws--],	[Wd--]
		[++Ws],	[++Wd]
		[--Ws],	[--Wd]

Operands:

Ws ∈ [W0 ... W15]
Wd ∈ [W0 ... W15]

Operation:

For Byte Operation:
(Ws<7>) → C
(Ws<6:0>) → Wd<7:1>
0 → Wd<0>

For Word Operation:
(Ws<15>) → C
(Ws<14:0>) → Wd<15:1>
0 → Wd<0>

Status Affected: N, Z, C

Encoding:

1101	0000	0Bqq	qddd	dppp	ssss

Description:

Shift the contents of the source register Ws, one bit to the left, and place the result in the destination register Wd. The Most Significant bit of Ws is shifted into the Carry bit of the STATUS Register and '0' is shifted into the Least Significant bit of Wd. Either Register Direct or Indirect Addressing may be used for Ws and Wd.

The 'B' bit selects byte or word operation ('0' for word, '1' for byte).
The 'q' bits select the destination addressing mode.
The 'd' bits select the destination register.
The 'p' bits select the source addressing mode.
The 's' bits select the source register.

Note: The extension `.B` in the instruction denotes a byte operation rather than a word operation. You may use a `.W` extension to denote a word operation, but it is not required.

Words: 1

Cycles: 1[(1)]

Note 1: In dsPIC33E, dsPIC33C and PIC24E devices, the listed cycle count does not apply to read and Read-Modify-Write operations on non-CPU Special Function Registers. For more details, see **Note 3** in **Section 3.2.1 "Multicycle Instructions"**.

Shift Left by Short Literal

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax: {label:} SL Wb, #lit4, Wnd

Operands: Wb ∈ [W0 ... W15]
lit4 ∈ [0 ... 15]
Wnd ∈ [W0 ... W15]

Operation: lit4<3:0> → Shift_Val
Wnd<15:Shift_Val> = Wb<15-Shift_Val:0>
Wd<Shift_Val – 1:0> = 0

Status Affected: N, Z

Encoding:

1101	1101	0www	wddd	d100	kkkk

Description: Shift left the contents of the source register Wb by the 4-bit unsigned literal and store the result in the destination register Wnd. Any bits shifted out of the source register are lost. Direct Addressing must be used for Wb and Wnd.

The 'w' bits select the address of the base register.
The 'd' bits select the destination register.
The 'k' bits provide the literal operand, a five-bit integer number.

Note: This instruction operates in Word mode only.

Words: 1

Cycles: 1

Example 1:
```
SL   W2, #4, W2   ; Shift left W2 by 4
                  ; Store result to W2
```

	Before Instruction		After Instruction

SL

Shift Left by Wns

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax: {label:} SL Wb, Wns, Wnd

Operands:
Wb ∈ [W0 ... W15]
Wns ∈ [W0 ...W15]
Wnd ∈ [W0 ... W15]

Operation:
Wns<4:0> → Shift_Val
Wnd<15:Shift_Val> = Wb<15 – Shift_Val:0>
Wd<Shift_Val – 1:0> = 0

Status Affected: N, Z

Encoding:

1101	1101	0www	wddd	d000	ssss

Description: Shift left the contents of the source register Wb by the 5 Least Significant bits of Wns (only up to 15 positions) and store the result in the destination register Wnd. Any bits shifted out of the source register are lost. Register Direct Addressing must be used for Wb, Wns and Wnd.

The ‘w’ bits select the address of the base register.
The ‘d’ bits select the destination register.
The ‘s’ bits select the source register.

Note 1: This instruction operates in Word mode only.
2: If Wns is greater than 15, Wnd will be loaded with 0x0.

Words: 1

Cycles: 1

Example 1:
```
SL   W0, W1, W2   ; Shift left W0 by W1<0:4>
                  ; Store result to W2
```

SUB

Subtract WREG from f

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax: {label:} SUB{.B} f {,WREG}

Operands: f ∈ [0 ... 8191]

Operation: (f) – (WREG) → destination designated by D

Status Affected: DC, N, OV, Z, C

Encoding:

1011	0101	0BDf	ffff	ffff	ffff

Description: Subtract the contents of the default Working register WREG from the contents of the specified file register and place the result in the destination register. The optional WREG operand determines the destination register. If WREG is specified, the result is stored in WREG. If WREG is not specified, the result is stored in the file register.

The 'B' bit selects byte or word operation ('0' for word, '1' for byte).
The 'D' bit selects the destination register ('0' for WREG, '1' for file register).
The 'f' bits select the address of the file register.

Note 1: The extension .B in the instruction denotes a byte operation rather than a word operation. You may use a .W extension to denote a word operation, but it is not required.

2: The WREG is set to Working register W0.

Words: 1

Cycles: 1(1)

Note 1: In dsPIC33E, dsPIC33C and PIC24E devices, the listed cycle count does not apply to read and Read-Modify-Write operations on non-CPU Special Function Registers. For more details, see **Note 3** in **Section 3.2.1 "Multicycle Instructions"**.

Example 1:
```
SUB.B   0x1FFF          ; Sub. WREG from (0x1FFF) (Byte mode)
                        ; Store result to 0x1FFF

SUB

Subtract Literal from Wn

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax: {label:} SUB{.B} #lit10, Wn

Operands: lit10 ∈ [0 ... 255] for byte operation
lit10 ∈ [0 ... 1023] for word operation
Wn ∈ [W0 ... W15]

Operation: (Wn) – lit10 → Wn

Status Affected: DC, N, OV, Z, C

Encoding:

1011	0001	0Bkk	kkkk	kkkk	dddd

Description: Subtract the 10-bit unsigned literal operand from the contents of the Working register Wn and store the result back in the Working register Wn. Register Direct Addressing must be used for Wn.

The 'B' bit selects byte or word operation.
The 'k' bits specify the literal operand.
The 'd' bits select the address of the Working register.

Note 1: The extension `.B` in the instruction denotes a byte operation rather than a word operation. You may use a `.W` extension to denote a word operation, but it is not required.

2: For byte operations, the literal must be specified as an unsigned value [0:255]. See **Section 4.6 "Using 10-Bit Literal Operands"** for information on using 10-bit literal operands in Byte mode.

Words: 1

Cycles: 1

Example 1:

SUBB

Subtract WREG and Carry Bit from f

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax: {label:} SUBB{.B} f {,WREG}

Operands: f ∈ [0 ... 8191]

Operation: (f) – (WREG) – ($\overline{C}$) → destination designated by D

Status Affected: DC, N, OV, Z, C

Encoding:

1011	0101	1BDf	ffff	ffff	ffff

Description: Subtract the contents of the default Working register WREG and the Borrow flag (Carry flag inverse, $\overline{C}$) from the contents of the specified file register, and place the result in the destination register. The optional WREG operand determines the destination register. If WREG is specified, the result is stored in WREG. If WREG is not specified, the result is stored in the file register

The 'B' bit selects byte or word operation ('0' for word, '1' for byte).
The 'D' bit selects the destination register ('0' for WREG, '1' for file register).
The 'f' bits select the address of the file register.

Note 1: The extension .B in the instruction denotes a byte operation rather than a word operation. You may use a .W extension to denote a word operation, but it is not required.

2: The WREG is set to Working register W0.

3: The Z flag is "sticky" for ADDC, CPB, SUBB and SUBBR. These instructions can only clear Z.

Words: 1

Cycles: 1(1)

Note 1: In dsPIC33E, dsPIC33C and PIC24E devices, the listed cycle count does not apply to read and Read-Modify-Write operations on non-CPU Special Function Registers. For more details, see **Note 3** in **Section 3.2.1 "Multicycle Instructions"**.

SUBB

Subtract Wn from Literal with Borrow

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax: {label:} SUBB{.B} #lit10, Wn

Operands: lit10 ∈ [0 ... 255] for byte operation
lit10 ∈ [0 ... 1023] for word operation
Wn ∈ [W0 ... W15]

Operation: (Wn) – lit10 – ($\overline{C}$) → Wn

Status Affected: DC, N, OV, Z, C

Encoding:

1011	0001	1Bkk	kkkk	kkkk	dddd

Description: Subtract the unsigned 10-bit literal operand and the Borrow flag (Carry flag inverse, $\overline{C}$) from the contents of the Working register Wn, and store the result back in the Working register Wn. Register Direct Addressing must be used for Wn.

The 'B' bit selects byte or word operation ('0' for word, '1' for byte).
The 'k' bits specify the literal operand.
The 'd' bits select the address of the Working register.

Note 1: The extension .B in the instruction denotes a byte operation rather than a word operation. You may use a .w extension to denote a word operation, but it is not required.

2: For byte operations, the literal must be specified as an unsigned value [0:255]. See **Section 4.6 "Using 10-Bit Literal Operands"** for information on using 10-bit literal operands in Byte mode.

3: The Z flag is "sticky" for ADDC, CPB, SUBB and SUBBR. These instructions can only clear Z.

Words: 1

Cycles: 1

Example 1:
```
SUBB.B  #0x23, W0      ; Sub. 0x23 and C from W0 (Byte mode)

Operation: (Wb) – lit5 – ($\overline{C}$) → Wd

Status Affected: DC, N, OV, Z, C

Encoding:

0101	1www	wBqq	qddd	d11k	kkkk

Description:
Subtract the 5-bit unsigned literal operand and the Borrow flag (Carry flag inverse, $\overline{C}$) from the contents of the base register Wb, and place the result in the destination register Wd. Register Direct Addressing must be used for Wb. Either Register Direct or Indirect Addressing may be used for Wd.

The 'w' bits select the address of the base register.
The 'B' bit selects byte or word operation ('0' for word, '1' for byte).
The 'q' bits select the destination addressing mode.
The 'd' bits select the destination register.
The 'k' bits provide the literal operand, a five-bit integer number.

Note 1: The extension .B in the instruction denotes a byte operation rather than a word operation. You may use a .W extension to denote a word operation, but it is not required.

2: The Z flag is "sticky" for ADDC, CPB, SUBB and SUBBR. These instructions can only clear Z.

SUBB

Subtract Ws from Wb with Borrow

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax:

{label:}	SUBB{.B}	Wb,	Ws,	Wd
			[Ws],	[Wd]
			[Ws++],	[Wd++]
			[Ws--],	[Wd--]
			[++Ws],	[++Wd]
			[--Ws],	[--Wd]

Operands:

Wb ∈ [W0 ... W15]
Ws ∈ [W0 ... W15]
Wd ∈ [W0 ... W15]

Operation: (Wb) – (Ws) – ($\overline{C}$) → Wd

Status Affected: DC, N, OV, Z, C

Encoding:

0101	1www	wBqq	qddd	dppp	ssss

Description:

Subtract the contents of the source register Ws and the Borrow flag (Carry flag inverse, $\overline{C}$) from the contents of the base register Wb, and place the result in the destination register Wd. Register Direct Addressing must be used for Wb. Register Direct or Indirect Addressing may be used for Ws and Wd.

The 'w' bits select the address of the base register.
The 'B' bit selects byte or word operation ('0' for word, '1' for byte).
The 'q' bits select the destination addressing mode.
The 'd' bits select the destination register.
The 'p' bits select the source addressing mode.
The 's' bits select the source register.

Note 1: The extension .B in the instruction denotes a byte operation rather than a word operation. You may use a .W extension to denote a word operation, but it is not required.

2: The Z flag is "sticky" for ADDC, CPB, SUBB and SUBBR. These instructions can only clear Z.

Words: 1

Cycles: 1(1)

Note 1: In dsPIC33E, dsPIC33C and PIC24E devices, the listed cycle count does not apply to read and Read-Modify-Write operations on non-CPU Special Function Registers. For more details, see **Note 3** in **Section 3.2.1 "Multicycle Instructions"**.

SUBBR

Subtract f from WREG with Borrow

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax: {label:} SUBBR{.B} f {,WREG}

Operands: f ∈ [0 ... 8191]

Operation: (WREG) – (f) – ($\overline{C}$) → destination designated by D

Status Affected: DC, N, OV, Z, C

Encoding:

1011	1101	1BDf	ffff	ffff	ffff

Description: Subtract the contents of the specified file register f and the Borrow flag (Carry flag inverse, $\overline{C}$) from the contents of WREG, and place the result in the destination register. The optional WREG operand determines the destination register. If WREG is specified, the result is stored in WREG. If WREG is not specified, the result is stored in the file register.

The 'B' bit selects byte or word operation ('0' for word, '1' for byte).
The 'D' bit selects the destination register ('0' for WREG, '1' for file register).
The 'f' bits select the address of the file register.

Note 1: The extension .B in the instruction denotes a byte operation rather than a word operation. You may use a .W extension to denote a word operation, but it is not required.

2: The WREG is set to Working register W0.

3: The Z flag is "sticky" for ADDC, CPB, SUBB and SUBBR. These instructions can only clear Z.

Words: 1

Cycles: 1(1)

Note 1: In dsPIC33E, dsPIC33C and PIC24E devices, the listed cycle count does not apply to read and Read-Modify-Write operations on non-CPU Special Function Registers. For more details, see **Note 3** in **Section 3.2.1 "Multicycle Instructions"**.

Example 1:
```
SUBBR.B    0x803          ; Sub. (0x803) and C from WREG (Byte mode)
                          ; Store result to 0x803

SUBBR

Subtract Wb from Short Literal with Borrow

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax: {label:} SUBBR{.B} Wb, #lit5, Wd
[Wd]
[Wd++]
[Wd--]
[++Wd]
[--Wd]

Operands: Wb ∈ [W0 ... W15]
lit5 ∈ [0 ... 31]
Wd ∈ [W0 ... W15]

Operation: lit5 – (Wb) – ($\overline{C}$) → Wd

Status Affected: DC, N, OV, Z, C

Encoding:

0001	1www	wBqq	qddd	d11k	kkkk

Description: Subtract the contents of the base register Wb and the Borrow flag (Carry flag inverse, $\overline{C}$) from the 5-bit unsigned literal, and place the result in the destination register Wd. Register Direct Addressing must be used for Wb. Register Direct or Indirect Addressing must be used for Wd.

The 'w' bits select the address of the base register.
The 'B' bit selects byte or word operation ('0' for word, '1' for byte).
The 'q' bits select the destination addressing mode.
The 'd' bits select the destination register.
The 'k' bits provide the literal operand, a five-bit integer number.

Note 1: The extension .B in the instruction denotes a byte operation rather than a word operation. You may use a .W extension to denote a word operation, but it is not required.

2: The Z flag is "sticky" for ADDC, CPB, SUBB and SUBBR. These instructions can only clear Z.

SUBR

Subtract f from WREG

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax: {label:} SUBR{.B} f {,WREG}

Operands: f ∈ [0 ... 8191]

Operation: (WREG) – (f) → destination designated by D

Status Affected: DC, N, OV, Z, C

Encoding:

1011	1101	0BDf	ffff	ffff	ffff

Description: Subtract the contents of the specified file register from the contents of the default Working register WREG and place the result in the destination register. The optional WREG operand determines the destination register. If WREG is specified, the result is stored in WREG. If WREG is not specified, the result is stored in the file register

The 'B' bit selects byte or word operation ('0' for word, '1' for byte).
The 'D' bit selects the destination register ('0' for WREG, '1' for file register).
The 'f' bits select the address of the file register.

Note 1: The extension .B in the instruction denotes a byte operation rather than a word operation. You may use a .W extension to denote a word operation, but it is not required.

2: The WREG is set to Working register W0.

SUBR

Subtract Wb from Short Literal

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax: {label:} SUBR{.B} Wb, #lit5, Wd
[Wd]
[Wd++]
[Wd--]
[++Wd]
[--Wd]

Operands: Wb ∈ [W0 ... W15]
lit5 ∈ [0 ... 31]
Wd ∈ [W0 ... W15]

Operation: lit5 – (Wb) → Wd

Status Affected: DC, N, OV, Z, C

Encoding:

0001	0www	wBqq	qddd	d11k	kkkk

Description: Subtract the contents of the base register Wb from the unsigned 5-bit literal operand and place the result in the destination register Wd. Register Direct Addressing must be used for Wb. Either Register Direct or Indirect Addressing may be used for Wd.

The 'w' bits select the address of the base register.
The 'B' bit selects byte or word operation ('0' for word, '1' for byte).
The 'q' bits select the destination addressing mode.
The 'd' bits select the destination register.
The 'k' bits provide the literal operand, a five-bit integer number.

Note: The extension .B in the instruction denotes a byte operation rather than a word operation. You may use a .W extension to denote a word operation, but it is not required.

Words: 1

SUBR

Subtract Wb from Ws

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax:

{label:}	SUBR{.B}	Wb,	Ws,	Wd
			[Ws],	[Wd]
			[Ws++],	[Wd++]
			[Ws--],	[Wd--]
			[++Ws],	[++Wd]
			[--Ws],	[--Wd]

Operands:

Wb ∈ [W0 ... W15]
Ws ∈ [W0 ... W15]
Wd ∈ [W0 ... W15]

Operation: (Ws) – (Wb) → Wd

Status Affected: DC, N, OV, Z, C

Encoding:

0001	0www	wBqq	qddd	dppp	ssss

Description:

Subtract the contents of the base register Wb from the contents of the source register Ws and place the result in the destination register Wd. Register Direct Addressing must be used for Wb. Either Register Direct or Indirect Addressing may be used for Ws and Wd.

The ‘w’ bits select the address of the base register.
The ‘B’ bit selects byte or word operation (‘0’ for word, ‘1’ for byte).
The ‘q’ bits select the destination addressing mode.
The ‘d’ bits select the destination register.
The ‘p’ bits select the source addressing mode.
The ‘s’ bits select the source register.

Note: The extension `.B` in the instruction denotes a byte operation rather than a word operation. You may use a `.W` extension to denote a word operation, but it is not required.

Words: 1

Cycles: 1(1)

Note 1: In dsPIC33E, dsPIC33C and PIC24E devices, the listed cycle count does not apply to read and Read-Modify-Write operations on non-CPU Special Function Registers. For more details, see **Note 3** in **Section 3.2.1 “Multicycle Instructions”**.

Example 1:
```
SUBR.B  W0, W1, W0          ; Sub. W0 from W1 (Byte mode)

SWAP

Byte or Nibble Swap Wn

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax: {label:} SWAP{.B} Wn

Operands: Wn ∈ [W0 ... W15]

Operation:

For Byte Operation:
(Wn)<7:4> ↔ (Wn)<3:0>

For Word Operation:
(Wn)<15:8> ↔ (Wn)<7:0>

Status Affected: None

Encoding:

1111	1101	1B00	0000	0000	ssss

Description: Swap the contents of the Working register Wn. In Word mode, the two bytes of Wn are swapped. In Byte mode, the two nibbles of the Least Significant Byte of Wn are swapped and the Most Significant Byte of Wn is unchanged. Register Direct Addressing must be used for Wn.

The 'B' bit selects byte or word operation ('0' for word, '1' for byte).
The 's' bits select the address of the Working register.

Note: The extension .B in the instruction denotes a byte operation rather than a word operation. You may use a .W extension to denote a word operation, but it is not required.

Words: 1

TBLRDH

Table Read High

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax:

{label:}	TBLRDH{.B}	[Ws],	Wd
		[Ws++],	[Wd]
		[Ws--],	[Wd++]
		[++Ws],	[Wd--]
		[--Ws],	[++Wd]
			[--Wd]

Operands:

Ws ∈ [W0 ... W15]
Wd ∈ [W0 ... W15]

Operation:

For Byte Operation:
If (LSB(Ws) = 1):
0 → Wd
Else:
Program Mem [(TBLPAG),(Ws)] <23:16> → Wd

For Word Operation:
Program Mem [(TBLPAG),(Ws)] <23:16> → Wd <7:0>
0 → Wd <15:8>

Status Affected: None

Encoding:

1011	1010	1Bqq	qddd	dppp	ssss

Description:

Read the contents of the most significant word of program memory and store it to the destination register Wd. The target word address of program memory is formed by concatenating the 8-bit Table Pointer register, TBLPAG<7:0>, with the Effective Address specified by Ws. Indirect Addressing must be used for Ws and either Register Direct or Indirect Addressing may be used for Wd.

In Word mode, zero is stored to the Most Significant Byte of the destination register (due to non-existent program memory), and the third program memory byte (PM<23:16>) at the specified program memory address, is stored to the Least Significant Byte of the destination register.

In Byte mode, the source address depends on the contents of Ws. If Ws is not word-aligned, zero is stored to the destination register (due to non-existent program memory). If Ws is word-aligned, the third program memory byte (PM<23:16>), at the specified program memory address, is stored to the destination register.

The 'B' bit selects byte or word operation ('0' for word, '1' for byte).
The 'q' bits select the destination addressing mode.
The 'd' bits select the destination register.
The 'p' bits select the source addressing mode.
The 's' bits select the source register.

Note: The extension `.B` in the instruction denotes a byte move rather than a word move. You may use a `.W` extension to denote a word move, but it is not required.

TBLRDL

Table Read Low

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax:

{label:}	TBLRDL{.B}	[Ws],	Wd
		[Ws++],	[Wd]
		[Ws--],	[Wd++]
		[++Ws],	[Wd--]
		[--Ws],	[++Wd]
			[--Wd]

Operands:

Ws ∈ [W0 ... W15]
Wd ∈ [W0 ... W15]

Operation:

For Byte Operation:
If (LSB(Ws) = 1):
Program Mem [(TBLPAG),(Ws)] <15:8> → Wd
Else:
Program Mem [(TBLPAG),(Ws)] <7:0> → Wd
For Word Operation:
Program Mem [(TBLPAG),(Ws)] <15:0> → Wd

Status Affected: None

Encoding:

1011	1010	0Bqq	qddd	dppp	ssss

Description:

Read the contents of the least significant word of program memory and store it to the destination register Wd. The target word address of program memory is formed by concatenating the 8-bit Table Pointer register, TBLPAG<7:0>, with the Effective Address specified by Ws. Indirect Addressing must be used for Ws and either Register Direct or Indirect Addressing may be used for Wd.

In Word mode, the lower 2 bytes of program memory are stored to the destination register. In Byte mode, the source address depends on the contents of Ws. If Ws is not word-aligned, the second byte of the program memory word (PM<15:7>) is stored to the destination register. If Ws is word-aligned, the first byte of the program memory word (PM<7:0>) is stored to the destination register.

The 'B' bit selects byte or word operation ('0' for word mode, '1' for byte).
The 'q' bits select the destination addressing mode.
The 'd' bits select the destination register.
The 'p' bits select the source addressing mode.
The 's' bits select the source register.

Note: The extension .B in the instruction denotes a byte move rather than a word move. You may use a .W extension to denote a word move, but it is not required.

TBLWTH

Table Write High

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax: {label:} TBLWTH{.B} Ws, [Wd]
[Ws], [Wd++]
[Ws++], [Wd--]
[Ws--], [++Wd]
[++Ws], [--Wd]
[--Ws],

Operands: Ws ∈ [W0 ... W15]
Wd ∈ [W0 ... W15]

Operation:
For Byte Operation:
If (LSB(Wd) = 1):
NOP
Else:
(Ws) → Program Mem [(TBLPAG),(Wd)]<23:16>
For Word Operation:
(Ws)<7:0> → Program Mem [(TBLPAG),(Wd)] <23:16>

Status Affected: None

Encoding:

1011	1011	1Bqq	qddd	dppp	ssss

Description: Store the contents of the working source register Ws to the most significant word of program memory. The destination word address of program memory is formed by concatenating the 8-bit Table Pointer register, TBLPAG<7:0>, with the Effective Address specified by Wd. Either Direct or Indirect Addressing may be used for Ws and Indirect Addressing must be used for Wd.

Since program memory is 24 bits wide, this instruction can only write to the upper byte of program memory (PM<23:16>). This may be performed using a Wd that is word-aligned in Byte mode or Word mode. If Byte mode is used with a Wd that is not word-aligned, no operation is performed.

The 'B' bit selects byte or word operation ('0' for word, '1' for byte).
The 'q' bits select the destination addressing mode.
The 'd' bits select the destination register.
The 'p' bits select the source addressing mode.
The 's' bits select the source register.

Note: The extension .B in the instruction denotes a byte move rather than a word move. You may use a .W extension to denote a word move, but it is not required.

Words: 1

Cycles: 2(1)

Note 1: In dsPIC33E, dsPIC33C and PIC24E devices, the listed cycle count does not apply to read and Read-Modify-Write operations on non-CPU Special Function Registers. For more details, see **Note 3** in **Section 3.2.1 "Multicycle Instructions"**.

© 2005-2018 Microchip Technology Inc.

Example 1:
```
TBLWTH.B  [W0++], [W1]   ; Write [W0]... (Byte mode)
                         ; to PM Latch High (TBLPAG:[W1])
                         ; Post-increment W0
```

TBLWTL

Table Write Low

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax:

{label:}	TBLWTL{.B}	Ws,	[Wd]
		[Ws],	[Wd++]
		[Ws++],	[Wd--]
		[Ws--],	[++Wd]
		[++Ws],	[--Wd]
		[--Ws],	

Operands:

Ws ∈ [W0 ... W15]
Wd ∈ [W0 ... W15]

Operation:

For Byte Operation:
If (LSB(Wd) = 1):
(Ws) → Program Mem [(TBLPAG),(Wd)] <15:8>
Else:
(Ws) → Program Mem [(TBLPAG),(Wd)] <7:0>
For Word Operation:
(Ws) → Program Mem [(TBLPAG),(Wd)] <15:0>

Status Affected: None

Encoding:

1011	1011	0Bqq	qddd	dppp	ssss

Description:

Store the contents of the working source register Ws to the least significant word of program memory. The destination word address of program memory is formed by concatenating the 8-bit Table Pointer register, TBLPAG<7:0>, with the Effective Address specified by Wd. Either Direct or Indirect Addressing may be used for Ws and Indirect Addressing must be used for Wd.

In Word mode, Ws is stored to the lower 2 bytes of program memory. In Byte mode, the Least Significant bit of Wd determines the destination byte. If Wd is not word-aligned, Ws is stored to the second byte of program memory (PM<15:8>). If Wd is word-aligned, Ws is stored to the first byte of program memory (PM<7:0>).

The 'B' bit selects byte or word operation ('0' for word, '1' for byte).
The 'q' bits select the destination addressing mode.
The 'd' bits select the destination register.
The 'p' bits select the source addressing mode.
The 's' bits select the source register.

Note: The extension .B in the instruction denotes a byte move rather than a word move. You may use a .W extension to denote a word move, but it is not required.

VFSLV

Verify Slave Processor Program RAM

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
							X

Syntax: {label:} VFSLV [Wns], [Wnd++], #lit2
[Wns++],

Operands: Wns ∈ [W0 ... W15];
Wnd ∈ [W0 ... W15];
lit2 ∈ [0 ... 3];

Operation: If Master (EAs) ! = Slave EAd
Master VERFERR (MSIxSTAT<11>) = 1

Status Affected: None

Encoding:

0000	0011	10kk	0ddd	d0p1	ssss

Description: This instruction reads a single instruction word from the target Slave PRAM image (held in the Master program space Flash) and compares it to the value in the Slave PRAM at the destination address. The source address must be located within PSV address space (i.e., DSRPAG ≥ 0x200). The destination address uses DSWPAG and the destination EA to create a 24-bit Slave program space PRAM write address.

Starting with an aligned double instruction word (destination address, see **Note 1**), the contents of the source Effective Address (in Master program space) are compared with the destination Effective Address (in the Slave PRAM address space) in order to verify the PRAM contents.

If the (single instruction word) destination address is even, the data is captured in the Slave PRAM wrapper. If the (single instruction word) destination address is odd, the ECC parity bits are calculated from the current and captured source data (48 bits), and compared. If the data and ECC parity are not the same, the VERFERR (MSIxSTAT<11>) status bit is set.

The target Slave processor is selected by the value defined by lit2.

The instruction may be regarded as a PSV operation, and therefore, may be executed within a REPEAT loop to accelerate data processing.

The 's' bits select the address of the source register.
The 'd' bits select the address of the destination register.
The 'k' bits select the target Slave processor.
The 'p' bit selects the destination addressing mode (see **Note 1**).

Note 1: This instruction supports a subset of addressing modes. The source addressing mode bit field is constrained to 2 options and the destination addressing mode bit field is not required.

2: An aligned double instruction word destination address is an even address that addresses the least significant word of a double instruction word.

3: This instruction only supports Word mode.

Words: 1

Cycles: 1

XOR

Exclusive OR f and WREG

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax: {label:} XOR{.B} f {,WREG}

Operands: f ∈ [0 ... 8191]

Operation: (f).XOR.(WREG) → destination designated by D

Status Affected: N, Z

Encoding:

1011	0110	1BDf	ffff	ffff	ffff

Description: Compute the logical exclusive OR operation of the contents of the default Working register WREG and the contents of the specified file register, and place the result in the destination register. The optional WREG operand determines the destination register. If WREG is specified, the result is stored in WREG. If WREG is not specified, the result is stored in the file register.

The 'B' bit selects byte or word operation ('0' for word, '1' for byte).
The 'D' bit selects the destination register ('0' for WREG, '1' for file register).
The 'f' bits select the address of the file register.

Note 1: The extension .B in the instruction denotes a byte operation rather than a word operation. You may use a .W extension to denote a word operation, but it is not required.

2: The WREG is set to working register W0.

Words: 1

Cycles: 1(1)

Note 1: In dsPIC33E, dsPIC33C and PIC24E devices, the listed cycle count does not apply to read and Read-Modify-Write operations on non-CPU Special Function Registers. For more details, see **Note 3** in **Section 3.2.1 "Multi-Cycle Instructions"**.

Example 1:
```
XOR.B  0x1FFF       ; XOR (0x1FFF) and WREG (Byte mode)
                    ; Store result to 0x1FFF
```

XOR

Exclusive OR Literal and Wn

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax: {label:} XOR{.B} #lit10, Wn

Operands: lit10 ∈ [0 ... 255] for byte operation
lit10 ∈ [0 ... 1023] for word operation
Wn ∈ [W0 ... W15]

Operation: lit10.XOR.(Wn) → Wn

Status Affected: N, Z

Encoding:

1011	0010	1Bkk	kkkk	kkkk	dddd

Description: Compute the logical exclusive OR operation of the unsigned 10-bit literal operand and the contents of the Working register Wn, and store the result back in the Working register Wn. Register Direct Addressing must be used for Wn.

The 'B' bit selects byte or word operation ('0' for word, '1' for byte).
The 'k' bits specify the literal operand.
The 'd' bits select the address of the Working register.

Note 1: The extension `.B` in the instruction denotes a byte operation rather than a word operation. You may use a `.W` extension to denote a word operation, but it is not required.

2: For byte operations, the literal must be specified as an unsigned value [0:255]. See **Section 4.6 "Using 10-bit Literal Operands"** for information on using 10-bit literal operands in Byte mode.

Words: 1

Cycles: 1

Example 1:

```
XOR.B  #0x23, W0     ; XOR 0x23 and W0 (Byte mode)

XOR

Exclusive OR Wb and Short Literal

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax: {label:} XOR{.B} Wb, #lit5, Wd
[Wd]
[Wd++]
[Wd--]
[++Wd]
[--Wd]

Operands: Wb ∈ [W0 ... W15]
lit5 ∈ [0 ... 31]
Wd ∈ [W0 ... W15]

Operation: (Wb).XOR.lit5 → Wd

Status Affected: N, Z

Encoding:

0110	1www	wBqq	qddd	d11k	kkkk

Description: Compute the logical exclusive OR operation of the contents of the base register Wb and the unsigned 5-bit literal operand, and place the result in the destination register Wd. Register Direct Addressing must be used for Wb. Either Register Direct or Indirect Addressing may be used for Wd.

The 'w' bits select the address of the base register.
The 'B' bit selects byte or word operation ('0' for word, '1' for byte).
The 'q' bits select the destination addressing mode.
The 'd' bits select the destination register.
The 'k' bits provide the literal operand, a 5-bit integer number.

Note: The extension .B in the instruction denotes a byte operation rather than a word operation. You may use a .W extension to denote a word operation, but it is not required.

Words: 1

Cycles: 1

Example 1:

```
XOR.B  W4, #0x14, W5       ; XOR W4 and 0x14 (Byte mode)
                           ; Store result to W5

XOR

Exclusive OR Wb and Ws

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax:

{label:}	XOR{.B}	Wb,	Ws,	Wd
			[Ws],	[Wd]
			[Ws++],	[Wd++]
			[Ws--],	[Wd--]
			[++Ws],	[++Wd]
			[--Ws],	[--Wd]

Operands:

Wb ∈ [W0 ... W15]
Ws ∈ [W0 ... W15]
Wd ∈ [W0 ... W15]

Operation: (Wb).XOR.(Ws) → Wd

Status Affected: N, Z

Encoding:

0110	1www	wBqq	qddd	dppp	ssss

Description:

Compute the logical exclusive OR operation of the contents of the source register Ws and the contents of the base register Wb, and place the result in the destination register Wd. Register Direct Addressing must be used for Wb. Either Register Direct or Indirect Addressing may be used for Ws and Wd.

The 'w' bits select the address of the base register.
The 'B' bit selects byte or word operation ('0' for word, '1' for byte).
The 'q' bits select the destination addressing mode.
The 'd' bits select the destination register.
The 'p' bits select the source addressing mode.
The 's' bits select the source register.

Note: The extension `.B` in the instruction denotes a byte operation rather than a word operation. You may use a `.W` extension to denote a word operation, but it is not required.

Words: 1

Cycles: 1(1)

Note 1: In dsPIC33E, dsPIC33C and PIC24E devices, the listed cycle count does not apply to read and Read-Modify-Write operations on non-CPU Special Function Registers. For more details, see **Note 3** in **Section 3.2.1 "Multi-Cycle Instructions"**.

© 2005-2018 Microchip Technology Inc.

Example 1:

```
XOR.B  W1, [W5++], [W9++]     ; XOR W1 and [W5] (Byte mode)
                              ; Store result to [W9]
                              ; Post-increment W5 and W9
```

	Before Instruction		After Instruction	
W1	AAAA	W1	AAAA	
W5	2000	W5	2001	
W9	2600	W9	2601	
Data 2000	115A	Data 2000	115A	
Data 2600	0000	Data 2600	00F0	
SR	0000	SR	0008	(N = 1)

Example 2:

```
XOR    W1, W5, W9             ; XOR W1 and W5 (Word mode)
                              ; Store the result to W9
```

	Before Instruction		After Instruction	
W1	FEDC	W1	FEDC	
W5	1234	W5	1234	
W9	A34D	W9	ECE8	
SR	0000	SR	0008	(N = 1)

© 2005-2018 Microchip Technology Inc.

ZE

Zero-Extend Ws

Implemented in:	PIC24F	PIC24H	PIC24E	dsPIC30F	dsPIC33F	dsPIC33E	dsPIC33C
	X	X	X	X	X	X	X

Syntax: {label:} ZE Ws, Wnd
[Ws],
[Ws++],
[Ws--],
[++Ws],
[--Ws],

Operands: Ws ∈ [W0 ... W15]
Wnd ∈ [W0 ... W15]

Operation: Ws<7:0> → Wnd<7:0>
0 → Wnd<15:8>

Status Affected: N, Z, C

Encoding:

1111	1011	1000	0ddd	dppp	ssss

Description: Zero-extend the Least Significant Byte in source Working register Ws to a 16-bit value and store the result in the destination Working register Wnd. Either Register Direct or Indirect Addressing may be used for Ws and Register Direct Addressing must be used for Wnd. The N flag is cleared and the C flag is set because the zero-extended word is always positive.

The 'd' bits select the destination register.
The 'p' bits select the source addressing mode.
The 's' bits select the source register.

Note 1: This operation converts a byte to a word and it uses no `.B` or `.W` extension.

2: The source Ws is addressed as a byte operand, so any address modification is by one.

Words: 1

Cycles: 1(1)

Note 1: In dsPIC33E, dsPIC33C and PIC24E devices, the listed cycle count does not apply to read and Read-Modify-Write operations on non-CPU Special Function Registers. For more details, see **Note 3** in **Section 3.2.1 "Multi-Cycle Instructions"**.

© 2005-2018 Microchip Technology Inc.

Example 1:
```
ZE  W3, W4          ; zero-extend W3
                    ; Store result to W4
```

	Before Instruction		After Instruction	
W3	7839	W3	7839	
W4	1005	W4	0039	
SR	0000	SR	0001	(C = 1)

Example 2:
```
ZE  [W2++], W12     ; Zero-extend [W2]
                    ; Store to W12
                    ; Post-increment W2
```

	Before Instruction		After Instruction	
W2	0900	W2	0901	
W12	1002	W12	008F	
Data 0900	268F	Data 0900	268F

Section 6. Built-in Functions

HIGHLIGHTS

This section of the manual contains the following major topics:

6.1 Introduction 460
6.2 Built-in Function List..... 461

6.1 INTRODUCTION

This section describes the built-in functions that are specific to the MPLAB® C Compiler for PIC24 MCUs and dsPIC® DSCs (formerly MPLAB C30).

Built-in functions give the C programmer access to assembler operators or machine instructions that are currently only accessible using in-line assembly, but are sufficiently useful that they are applicable to a broad range of applications. Built-in functions are coded in C source files syntactically like function calls, but they are compiled to assembly code that directly implements the function and does not involve function calls or library routines.

There are a number of reasons why providing built-in functions is preferable to requiring programmers to use in-line assembly. They include the following:

1. Providing built-in functions for specific purposes simplifies coding.
2. Certain optimizations are disabled when in-line assembly is used. This is not the case for built-in functions.
3. For machine instructions that use dedicated registers, coding in-line assembly while avoiding register allocation errors can require considerable care. The built-in functions make this process simpler as you do not need to be concerned with the particular register requirements for each individual machine instruction.

The built-in functions are listed below followed by their individual detailed descriptions.

- __builtin_addab
- __builtin_add
- __builtin_btg
- __builtin_clr
- __builtin_clr_prefetch
- __builtin_divf
- __builtin_divmodsd
- __builtin_divmodud
- __builtin_divsd
- __builtin_divud
- __builtin_dmaoffset
- __builtin_ed
- __builtin_edac
- __builtin_edsoffset
- __builtin_edspage
- __builtin_fbcl
- __builtin_lac
- __builtin_mac
- __builtin_modsd
- __builtin_modud
- __builtin_movsac
- __builtin_mpy
- __builtin_mpyn
- __builtin_msc
- __builtin_mulss
- __builtin_mulsu
- __builtin_mulus
- __builtin_muluu
- __builtin_nop
- __builtin_psvpage
- __builtin_psvoffset
- __builtin_readsfr
- __builtin_return_address
- __builtin_sac
- __builtin_sacr
- __builtin_sftac
- __builtin_subab
- __builtin_tbladdress
- __builtin_tblpage
- __builtin_tbloffset
- __builtin_tblrdh
- __builtin_tblrdl
- __builtin_tblwth
- __builtin_tblwtl

This section describes only the built-in functions related to the CPU operations. The compiler provides additional built-in functions for operations, such as writing to Flash program memory and changing the oscillator settings. Refer to the *"MPLAB® C Compiler for PIC24 MCUs and dsPIC® DSCs User's Guide"* (DS51284) for a complete list of compiler built-in functions.

© 2005-2018 Microchip Technology Inc.

6.2 BUILT-IN FUNCTION LIST

This section describes the programmer interface to the compiler built-in functions. Since the functions are “built-in”, there are no header files associated with them. Similarly, there are no command-line switches associated with the built-in functions – they are always available. The built-in function names are chosen such that they belong to the compiler’s namespace (they all have the prefix: `__builtin_`), so they will not conflict with function or variable names in the programmer’s namespace.

`__builtin_addab`

Description:

Adds Accumulators A and B with the result written back to the specified accumulator. For example:

```
register int result asm("A");
register int B asm("A");

result = __builtin_addab(result,B);
```

will generate:

```
add A
```

Prototype:

```
int __builtin_addab(int Accum_a, int Accum_b);
```

Argument:

`Accum_a` First accumulator to add.
`Accum_b` Second accumulator to add.

Return Value:

Returns the addition result to an accumulator.

Assembler Operator/Machine Instruction:

```
add
```

Error Messages:

An error message appears if the result is not an Accumulator register.

__builtin_add

Description:

Adds `value` to the accumulator specified by `result` with a shift specified by literal shift. For example:

```
register int result asm("A");
int      value;
result = __builtin_add(result,value,0);
```

If `value` is held in w0, the following will be generated:

```
add w0, #0, A
```

Prototype:

```
int   __builtin_add(int Accum,int value,
const int shift);
```

Argument:

Accum	Accumulator to add.
value	Integer number to add to accumulator value.
shift	Amount to shift resultant accumulator value.

Return Value:

Returns the shifted addition result to an accumulator.

Assembler Operator/Machine Instruction:

`add`

Error Messages:

An error message appears if:

- The result is not an Accumulator register
- Argument 0 is not an accumulator
- The shift value is not a literal within range

© 2005-2018 Microchip Technology Inc.

__builtin_btg

Description:

This function will generate a `btg` machine instruction. Some examples include:

```
int i;   /* near by default */
int l    __attribute__((far));

struct foo {
  int bit1:1;
} barbits;

int  bar;

void some_bittoggles() {
  register int j asm("w9");
  int k;

  k = i;

  __builtin_btg(&i,1);
  __builtin_btg(&j,3);
  __builtin_btg(&k,4);
  __builtin_btg(&l,11);

  return j+k;
}
```

Note that taking the address of a variable in a register will produce a warning by the compiler and cause the register to be saved onto the stack (so that its address may be taken); this form is not recommended. This caution only applies to variables explicitly placed in registers by the programmer.

Prototype:

```
void __builtin_btg(unsigned int *, unsigned int 0xn);
```

Argument:

* A pointer to the data item for which a bit should be toggled.
0x*n* A literal value in the range of 0 to 15.

Return Value:

Returns a `btg` machine instruction.

Assembler Operator/Machine Instruction:

```
btg
```

Error Messages:

An error message appears if the parameter values are not within range.

__builtin_clr

Description:

Clears the specified accumulator. For example:

```
register int result asm("A");
result = __builtin_clr();
```

will generate:

```
clr A
```

Prototype:

```
int __builtin_clr(void);
```

Argument:

None.

Return Value:

Returns the cleared value result to an accumulator.

Assembler Operator/Machine Instruction:

```
clr
```

Error Messages:

An error message appears if the result is not an Accumulator register.

© 2005-2018 Microchip Technology Inc.

__builtin_clr_prefetch

Description:

Clears an accumulator and prefetch data ready for a future MAC operation.

xptr may be null to signify no X prefetch to be performed; in which case, the values of *xincr* and *xval* are ignored, but required.

yptr may be null to signify no Y prefetch to be performed; in which case, the values of *yincr* and *yval* are ignored, but required.

xval and *yval* nominate the address of a C variable where the prefetched value will be stored.

xincr and *yincr* may be the literal values: -6, -4, -2, 0, 2, 4, 6 or an integer value.

If *AWB* is non-null, the other accumulator will be written back into the referenced variable.

For example:

```
register int result asm("A");
register int B asm("B");
int      x_memory_buffer[256]
__attribute__((space(xmemory)));
int      y_memory_buffer[256]
__attribute__((space(ymemory)));
int      *xmemory;
int      *ymemory;
int      awb;
int      xVal, yVal;

xmemory = x_memory_buffer;
ymemory = y_memory_buffer;
result  = __builtin_clr(&xmemory, &xVal, 2,
         &ymemory, &yVal, 2, &awb, B);
```

May generate:

```
clr A, [w8]+=2, w4, [w10]+=2, w5, w13
```

The compiler may need to spill w13 to ensure that it is available for the Write-Back. It may be recommended to users that the register be claimed for this purpose.

After this instruction:

- Result will be cleared
- xVal will contain x_memory_buffer[0]
- yVal will contain y_memory_buffer[0]
- xmemory and ymemory will be incremented by 2, ready for the next MAC operation

Prototype:

```
int __builtin_clr_prefetch(
int **xptr, int *xval, int xincr,
int **yptr, int *yval, int yincr, int *AWB,
int AWB_accum);
```

__builtin_clr_prefetch (Continued)

Argument:

xptr	Integer Pointer to X prefetch.
xval	Integer value of X prefetch.
xincr	Integer increment value of X prefetch.
yptr	Integer Pointer to Y prefetch.
yval	Integer value of Y prefetch.
yincr	Integer increment value of Y prefetch.
AWB	Accumulator Write-Back location.
AWB_accum	Accumulator to Write-Back.

Note: The arguments, *xptr* and *yptr*, must point to the arrays located in the X data memory and Y data memory, respectively.

Return Value:

Returns the cleared value result to an accumulator.

Assembler Operator/Machine Instruction:

```
clr
```

Error Messages:

An error message appears if:

- The result is not an Accumulator register
- *xval* is a null value but *xptr* is not null
- *yval* is a null value but *yptr* is not null
- *AWB_accum* is not an accumulator and *AWB* is not null

© 2005-2018 Microchip Technology Inc.

__builtin_divf

Description:

Computes the quotient: *num* / *den*. A math error exception occurs if *den* is zero. Function arguments are unsigned, as is the function result.

Prototype:

```
unsigned int __builtin_divf(unsigned int num,
unsigned int den);
```

Argument:

num Numerator.
den Denominator.

Return Value:

Returns the unsigned integer value of the quotient: *num* / *den*.

Assembler Operator/Machine Instruction:

```
div.f
```

__builtin_divmodsd

Description:

Issues the 16-bit architecture's native signed divide support. Notably, if the quotient does not fit into a 16-bit result, the results (including remainder) are unexpected. This form of the built-in function will capture both the quotient and remainder.

Prototype:

```
signed int  __builtin_divmodsd(
signed long dividend, signed int divisor,
signed int  *remainder);
```

Argument:

dividend Number to be divided.
divisor Number to divide by.
remainder Pointer to remainder.

Return Value:

Quotient and remainder.

Assembler Operator/Machine Instruction:

```
divmodsd
```

Error Messages:

None.

__builtin_divmodud

Description:

Issues the 16-bit architecture's native unsigned divide support. Notably, if the quotient does not fit into a 16-bit result, the results (including remainder) are unexpected. This form of the built-in function will capture both the quotient and remainder.

Prototype:

```
unsigned int  __builtin_divmodud(
unsigned long dividend, unsigned int divisor,
unsigned int  *remainder);
```

Argument:

dividend	Number to be divided.
divisor	Number to divide by.
remainder	Pointer to remainder.

Return Value:

Quotient and remainder.

Assembler Operator/Machine Instruction:

```
divmodud
```

Error Messages:

None.

__builtin_divsd

Description:

Computes the quotient: *num* / *den*. A math error exception occurs if *den* is zero. Function arguments are signed, as is the function result. The command-line option, `-Wconversions`, can be used to detect unexpected sign conversions.

Prototype:

```
int __builtin_divsd(const long num, const int den);
```

Argument:

num	Numerator.
den	Denominator.

Return Value:

Returns the signed integer value of the quotient: *num* / *den*.

Assembler Operator/Machine Instruction:

```
div.sd
```

© 2005-2018 Microchip Technology Inc.

__builtin_divud

Description:

Computes the quotient: *num* / *den*. A math error exception occurs if *den* is zero. Function arguments are unsigned, as is the function result. The command-line option, `-Wconversions`, can be used to detect unexpected sign conversions.

Prototype:

```
unsigned int  __builtin_divud(const unsigned
long     num, const unsigned int den);
```

Argument:

num Numerator.
den Denominator.

Return Value:

Returns the unsigned integer value of the quotient: *num* / *den*.

Assembler Operator/Machine Instruction:

```
div.ud
```

__builtin_dmaoffset

Description:

Obtains the offset of a symbol within DMA memory.

For example:

```
unsigned int         result;
char     buffer[256] __attribute__((space(dma)));

result = __builtin_dmaoffset(&buffer);
```

May generate:

```
mov #dmaoffset(buffer), w0
```

Prototype:

```
unsigned int __builtin_dmaoffset(const void *p);
```

Argument:

**p* Pointer to DMA address value.

Return Value:

Returns the offset to a variable located in DMA memory.

Assembler Operator/Machine Instruction:

```
dmaoffset
```

Error Messages:

An error message appears if the parameter is not the address of a global symbol.

__builtin_ed

Description:

Squares `sqr`, returning it as the result. Also prefetches data for future square operation by computing `**xptr - **yptr` and storing the result in `*distance`.

`xincr` and `yincr` may be the literal values: -6, -4, -2, 0, 2, 4, 6 or an integer value.

For example:

```
register int result asm("A");
int      *xmemory, *ymemory;
int      distance;

result = __builtin_ed(distance,
                      &xmemory, 2,
                      &ymemory, 2,
                      &distance);
```

May generate:

```
ed w4*w4, A, [w8]+=2, [W10]+=2, w4
```

Prototype:

```
int __builtin_ed(int sqr, int **xptr, int xincr,
int **yptr, int yincr, int *distance);
```

Argument:

sqr	Integer squared value.
xptr	Integer Pointer to pointer to X prefetch.
xincr	Integer increment value of X prefetch.
yptr	Integer Pointer to pointer to Y prefetch.
yincr	Integer increment value of Y prefetch.
distance	Integer Pointer to distance.

Note: The arguments, *xptr* and *yptr*, must point to the arrays located in the X data memory and Y data memory, respectively.

Return Value:

Returns the squared result to an accumulator.

Assembler Operator/Machine Instruction:

`ed`

Error Messages:

An error message appears if:

- The result is not an Accumulator register
- *xptr* is null
- *yptr* is null
- *distance* is null

© 2005-2018 Microchip Technology Inc.

__builtin_edac

Description:

Squares `sqr` and sums with the nominated Accumulator register, returning it as the result. Also prefetches data for future square operation by computing `**xptr - **yptr` and storing the result in `*distance`.

`xincr` and `yincr` may be the literal values: -6, -4, -2, 0, 2, 4, 6 or an integer value.

For example:

```
register int result asm("A");
int      *xmemory, *ymemory;
int      distance;

result = __builtin_ed(result, distance,
                      &xmemory, 2,
                      &ymemory, 2,
                      &distance);
```

May generate:

```
edac w4*w4, A, [w8]+=2, [W10]+=2, w4
```

Prototype:

```
int __builtin_edac(int Accum, int sqr,
int **xptr, int xincr, int **yptr, int yincr,
int *distance);
```

Argument:

Accum	Accumulator to sum.
sqr	Integer squared value.
xptr	Integer Pointer to pointer to X prefetch.
xincr	Integer increment value of X prefetch.
yptr	Integer Pointer to pointer to Y prefetch.
yincr	Integer increment value of Y prefetch.
distance	Integer Pointer to distance.

Note: The arguments, *xptr* and *yptr*, must point to the arrays located in the X data memory and Y data memory, respectively.

Return Value:

Returns the squared result to specified accumulator.

Assembler Operator/Machine Instruction:

```
edac
```

Error Messages:

An error message appears if:

- The result is not an Accumulator register
- *Accum* is not an Accumulator register
- *xptr* is null
- *yptr* is null
- *distance* is null

__builtin_edsoffset

Description:

Returns the EDS page offset of the object whose address is given as a parameter. The argument *p* must be the address of an object in Extended Data Space; otherwise, an error message is produced and the compilation fails. See the `space` attribute in **Section 2.3.1 "Specifying Attributes of Variables"** of the *"MPLAB® C Compiler for PIC24 MCUs and dsPIC® DSCs User's Guide"* (DS51284).

Prototype:

```
unsigned int __builtin_edsoffset(int *p);
```

Argument:

p Object address.

Return Value:

Returns the EDS page number of the object whose address is given as a parameter

Assembler Operator/Machine Instruction:

```
edsoffset
```

__builtin_edspage

Description:

Returns the EDS page number of the object whose address is given as a parameter. The argument *p* must be the address of an object in Extended Data Space; otherwise, an error message is produced and the compilation fails. See the `space` attribute in **Section 2.3.1 "Specifying Attributes of Variables"** of the *"MPLAB® C Compiler for PIC24 MCUs and dsPIC® DSCs User's Guide"* (DS51284).

Prototype:

```
unsigned int __builtin_edspage(int *p);
```

Argument:

p Object address.

Return Value:

Returns the EDS page number of the object whose address is given as a parameter.

Assembler Operator/Machine Instruction:

```
edspage
```

© 2005-2018 Microchip Technology Inc.

__builtin_fbcl

Description:

Finds the first bit change from left in value. This is useful for dynamic scaling of fixed-point data. For example:

```
int result, value;
result = __builtin_fbcl(value);
```

May generate:

```
fbcl w4, w5
```

Prototype:

```
int __builtin_fbcl(int value);
```

Argument:

value Integer number of first bit change.

Return Value:

Returns the shifted addition result to an accumulator.

Assembler Operator/Machine Instruction:

```
fbcl
```

Error Messages:

An error message appears if the result is not an Accumulator register.

__builtin_lac

Description:

Shifts value by *shift* (a literal between -8 and 7) and returns the value to be stored into the Accumulator register. For example:

```
register int result asm("A");
int      value;
result = __builtin_lac(value,3);
```

May generate:

```
lac w4, #3, A
```

Prototype:

```
int __builtin_lac(int value, int shift);
```

Argument:

value Integer number to be shifted.
shift Literal amount to shift.

Return Value:

Returns the shifted addition result to an accumulator.

Assembler Operator/Machine Instruction:

```
lac
```

Error Messages:

An error message appears if:

- The result is not an Accumulator register
- The shift value is not a literal within range

__builtin_mac

Description:

Computes *a* x *b* and sums with accumulator; also, prefetches data ready for a future MAC operation.

xptr may be null to signify no X prefetch to be performed; in which case, the values of *xincr* and *xval* are ignored, but required.

yptr may be null to signify no Y prefetch to be performed; in which case, the values of *yincr* and *yval* are ignored, but required.

xval and *yval* nominate the address of a C variable where the prefetched value will be stored.

xincr and *yincr* may be the literal values: -6, -4, -2, 0, 2, 4, 6 or an integer value.

If *AWB* is non-null, the other accumulator will be written back into the referenced variable.

For example:

```
register int result asm("A");
register int B asm("B");
int      *xmemory;
int      *ymemory;
int      xVal, yVal;

result = __builtin_mac(result, xVal, yVal,
                       &xmemory, &xVal, 2,
                       &ymemory, &yVal, 2, 0, B);
```

May generate:

```
mac w4*w5, A, [w8]+=2, w4, [w10]+=2, w5
```

Prototype:

```
int __builtin_mac(int Accum, int a, int b,
int **xptr, int *xval, int xincr,
int **yptr, int *yval, int yincr, int *AWB,
int AWB_accum);
```

Argument:

Accum	Accumulator to sum.
a	Integer multiplicand.
b	Integer multiplier.
xptr	Integer Pointer to pointer to X prefetch.
xval	Integer Pointer to value of X prefetch.
xincr	Integer increment value of X prefetch.
yptr	Integer Pointer to pointer to Y prefetch.
yval	Integer Pointer to value of Y prefetch.
yincr	Integer increment value of Y prefetch.
AWB	Accumulator Write-Back location.
AWB_accum	Accumulator to Write-Back.

Note: The arguments, *xptr* and *yptr*, must point to the arrays located in the X data memory and Y data memory, respectively.

Return Value:

Returns the cleared value result to an accumulator.

Assembler Operator/Machine Instruction:

mac

© 2005-2018 Microchip Technology Inc.

__builtin_mac (Continued)

Error Messages:

An error message appears if:

- The result is not an Accumulator register
- *Accum* is not an Accumulator register
- *xval* is a null value but *xptr* is not null
- *yval* is a null value but *yptr* is not null
- *AWB_accum* is not an Accumulator register and *AWB* is not null

__builtin_modsd

Description:

Issues the 16-bit architecture's native signed divide support. Notably, if the quotient does not fit into a 16-bit result, the results (including remainder) are unexpected. This form of the built-in function will capture only the remainder.

Prototype:

```
signed int __builtin_modsd(signed long dividend,
signed int divisor);
```

Argument:

dividend Number to be divided.
divisor Number to divide by.

Return Value:

Remainder.

Assembler Operator/Machine Instruction:

```
modsd
```

Error Messages:

None.

__builtin_modud

Description:

Issues the 16-bit architecture's native unsigned divide support. Notably, if the quotient does not fit into a 16-bit result, the results (including remainder) are unexpected. This form of the built-in function will capture only the remainder.

Prototype:

```
unsigned int __builtin_modud(unsigned long dividend,
unsigned int divisor);
```

Argument:

dividend Number to be divided.
divisor Number to divide by.

Return Value:

Remainder.

Assembler Operator/Machine Instruction:

```
modud
```

Error Messages:

None.

© 2005-2018 Microchip Technology Inc.

__builtin_movsac

Description:

Computes nothing, but prefetches data ready for a future MAC operation.

xptr may be null to signify no X prefetch to be performed; in which case, the values of *xincr* and *xval* are ignored, but required.

yptr may be null to signify no Y prefetch to be performed; in which case, the values of *yincr* and *yval* are ignored, but required.

xval and *yval* nominate the address of a C variable where the prefetched value will be stored.

xincr and *yincr* may be the literal values: -6, -4, -2, 0, 2, 4, 6 or an integer value.

If *AWB* is not null, the other accumulator will be written back into the referenced variable.

For example:

```
register int result asm("A");
int      *xmemory;
int      *ymemory;
int      xVal, yVal;

result = __builtin_movsac(&xmemory, &xVal, 2,
                          &ymemory, &yVal, 2, 0, 0);
```

May generate:

```
movsac A, [w8]+=2, w4, [w10]+=2, w5
```

Prototype:

```
int __builtin_movsac(
int **xptr, int *xval, int xincr,
int **yptr, int *yval, int yincr, int *AWB
int AWB_accum);
```

Argument:

xptr	Integer Pointer to pointer to X prefetch.
xval	Integer Pointer to value of X prefetch.
xincr	Integer increment value of X prefetch.
yptr	Integer Pointer to pointer to Y prefetch.
yval	Integer Pointer to value of Y prefetch.
yincr	Integer increment value of Y prefetch.
AWB	Accumulator Write-Back location.
AWB_accum	Accumulator to Write-Back.

Note: The arguments, *xptr* and *yptr*, must point to the arrays located in the X data memory and Y data memory, respectively.

Return Value:

Returns prefetch data.

Assembler Operator/Machine Instruction:

```
movsac
```

Error Messages:

An error message appears if:

- The result is not an Accumulator register
- *xval* is a null value but *xptr* is not null
- *yval* is a null value but *yptr* is not null
- *AWB_accum* is not an Accumulator register and *AWB* is not null

__builtin_mpy

Description:

Computes *a* x *b*; also, prefetches data ready for a future MAC operation.

xptr may be null to signify no X prefetch to be performed; in which case, the values of *xincr* and *xval* are ignored, but required.

yptr may be null to signify no Y prefetch to be performed; in which case, the values of *yincr* and *yval* are ignored, but required.

xval and *yval* nominate the address of a C variable where the prefetched value will be stored.

xincr and *yincr* may be the literal values: -6, -4, -2, 0, 2, 4, 6 or an integer value.

For example:

```
register int result asm("A");
int      *xmemory;
int      *ymemory;
int      xVal, yVal;

result = __builtin_mpy(xVal, yVal,
                       &xmemory, &xVal, 2,
                       &ymemory, &yVal, 2);
```

May generate:

```
mac w4*w5, A, [w8]+=2, w4, [w10]+=2, w5
```

Prototype:

```
int __builtin_mpy(int a, int b,
int **xptr, int *xval, int xincr,
int **yptr, int *yval, int yincr);
```

Argument:

a	Integer multiplicand.
b	Integer multiplier.
xptr	Integer Pointer to pointer to X prefetch.
xval	Integer Pointer to value of X prefetch.
xincr	Integer increment value of X prefetch.
yptr	Integer Pointer to pointer to Y prefetch.
yval	Integer Pointer to value of Y prefetch.
yincr	Integer increment value of Y prefetch.
AWB	Integer Pointer to accumulator selection.

Note: The arguments, *xptr* and *yptr*, must point to the arrays located in the X data memory and Y data memory, respectively.

Return Value:

Returns the cleared value result to an accumulator.

Assembler Operator/Machine Instruction:

```
mpy
```

Error Messages:

An error message appears if:

- The result is not an Accumulator register
- *xval* is a null value but *xptr* is not null
- *yval* is a null value but *yptr* is not null

© 2005-2018 Microchip Technology Inc.

__builtin_mpyn

Description:

Computes -*a* x *b*; also, prefetches data ready for a future MAC operation.

xptr may be null to signify no X prefetch to be performed; in which case, the values of *xincr* and *xval* are ignored, but required.

yptr may be null to signify no Y prefetch to be performed; in which case, the values of *yincr* and *yval* are ignored, but required.

xval and *yval* nominate the address of a C variable where the prefetched value will be stored.

xincr and *yincr* may be the literal values: -6, -4, -2, 0, 2, 4, 6 or an integer value.

For example:

```
register int result asm("A");
int      *xmemory;
int      *ymemory;
int      xVal, yVal;

result = __builtin_mpy(xVal, yVal,
                       &xmemory, &xVal, 2,
                       &ymemory, &yVal, 2);
```

May generate:

```
mac w4*w5, A, [w8]+=2, w4, [w10]+=2, w5
```

Prototype:

```
int __builtin_mpyn(int a, int b,
int **xptr, int *xval, int xincr,
int **yptr, int *yval, int yincr);
```

Argument:

a	Integer multiplicand.
b	Integer multiplier.
xptr	Integer Pointer to pointer to X prefetch.
xval	Integer Pointer to value of X prefetch.
xincr	Integer increment value of X prefetch.
yptr	Integer Pointer to pointer to Y prefetch.
yval	Integer Pointer to value of Y prefetch.
yincr	Integer increment value of Y prefetch.
AWB	Integer Pointer to accumulator selection.

Note: The arguments, *xptr* and *yptr*, must point to the arrays located in the X data memory and Y data memory, respectively.

Return Value:

Returns the cleared value result to an accumulator.

Assembler Operator/Machine Instruction:

```
mpyn
```

Error Messages:

An error message appears if:

- The result is not an Accumulator register
- *xval* is a null value but *xptr* is not null
- *yval* is a null value but *yptr* is not null

__builtin_msc

Description:

Computes *a* x *b* and subtracts from accumulator; also, prefetches data ready for a future MAC operation.

xptr may be null to signify no X prefetch to be performed; in which case, the values of *xincr* and *xval* are ignored, but required.

yptr may be null to signify no Y prefetch to be performed; in which case, the values of *yincr* and *yval* are ignored, but required.

xval and *yval* nominate the address of a C variable where the prefetched value will be stored.

xincr and *yincr* may be the literal values: -6, -4, -2, 0, 2, 4, 6 or an integer value.

If *AWB* is non-null, the other accumulator will be written back into the referenced variable.

For example:

```
register int result asm("A");
int      *xmemory;
int      *ymemory;
int      xVal, yVal;

result = __builtin_msc(result, xVal, yVal,
                       &xmemory, &xVal, 2,
                       &ymemory, &yVal, 2, 0, 0);
```

May generate:

```
msc w4*w5, A, [w8]+=2, w4, [w10]+=2, w5
```

Prototype:

```
int __builtin_msc(int Accum, int a, int b,
int **xptr, int *xval, int xincr,
int **yptr, int *yval, int yincr, int *AWB,
int AWB_accum);
```

Argument:

Accum	Accumulator to sum.
a	Integer multiplicand.
b	Integer multiplier.
xptr	Integer Pointer to pointer to X prefetch.
xval	Integer Pointer to value of X prefetch.
xincr	Integer increment value of X prefetch.
yptr	Integer Pointer to pointer to Y prefetch.
yval	Integer Pointer to value of Y prefetch.
yincr	Integer increment value of Y prefetch.
AWB	Accumulator Write-Back location.
AWB_accum	Accumulator to Write-Back.

Note: The arguments, *xptr* and *yptr*, must point to the arrays located in the X data memory and Y data memory, respectively.

Return Value:

Returns the cleared value result to an accumulator.

Assembler Operator/Machine Instruction:

```
msc
```

© 2005-2018 Microchip Technology Inc.

__builtin_msc (Continued)

Error Messages:

An error message appears if:

- The result is not an Accumulator register
- *Accum* is not an Accumulator register
- *xval* is a null value but *xptr* is not null
- *yval* is a null value but *yptr* is not null
- *AWB_accum* is not an Accumulator register and *AWB* is not null

__builtin_mulss

Description:

Computes the product *p0* x *p1*. Function arguments are signed integers and the function result is a signed long integer. The command-line option, `-Wconversions`, can be used to detect unexpected sign conversions.

Prototype:

```
signed long __builtin_mulss(const signed int p0, const signed int p1);
```

Argument:

p0 Multiplicand.
p1 Multiplier.

Return Value:

Returns the signed long integer value of the product *p0* x *p1*.

Assembler Operator/Machine Instruction:

```
mul.ss
```

__builtin_mulsu

Description:

Computes the product *p0* x *p1*. Function arguments are integers with mixed signs and the function result is a signed long integer. The command-line option, `-Wconversions`, can be used to detect unexpected sign conversions. This function supports the full range of addressing modes of the instruction, including Immediate mode for operand *p1*.

Prototype:

```
signed long __builtin_mulsu(const signed int p0, const unsigned int p1);
```

Argument:

p0 Multiplicand.
p1 Multiplier.

Return Value:

Returns the signed long integer value of the product *p0* x *p1*.

Assembler Operator/Machine Instruction:

```
mul.su
```

© 2005-2018 Microchip Technology Inc.

__builtin_mulus

Description:

Computes the product *p0* x *p1*. Function arguments are integers with mixed signs and the function result is a signed long integer. The command-line option, `-Wconversions`, can be used to detect unexpected sign conversions. This function supports the full range of addressing modes of the instruction.

Prototype:

```
signed long __builtin_mulus(const unsigned int p0, const signed int p1);
```

Argument:

p0 Multiplicand.
p1 Multiplier.

Return Value:

Returns the signed long integer value of the product *p0* x *p1*.

Assembler Operator/Machine Instruction:

```
mul.us
```

__builtin_muluu

Description:

Computes the product *p0* x *p1*. Function arguments are unsigned integers and the function result is an unsigned long integer. The command-line option, `-Wconversions`, can be used to detect unexpected sign conversions. This function supports the full range of addressing modes of the instruction, including Immediate mode for operand *p1*.

Prototype:

```
unsigned long __builtin_muluu(const unsigned int p0, const unsigned int p1);
```

Argument:

p0 Multiplicand.
p1 Multiplier.

Return Value:

Returns the signed long integer value of the product *p0* x *p1*.

Assembler Operator/Machine Instruction:

```
mul.uu
```

__builtin_nop

Description:

Generates a NOP instruction.

Prototype:

```
void __builtin_nop(void);
```

Argument:

None.

Return Value:

Returns a no operation (NOP).

Assembler Operator/Machine Instruction:

NOP

__builtin_psvoffset

Description:

Returns the PSV page offset of the object whose address is given as a parameter. The argument *p* must be the address of an object in an EE data, PSV or executable memory space; otherwise, an error message is produced and the compilation fails. See the space attribute in **Section 2.3.1 "Specifying Attributes of Variables"** of the *"MPLAB® C Compiler for PIC24 MCUs and dsPIC® DSCs User's Guide"* (DS51284).

Prototype:

```
unsigned int __builtin_psvoffset(const void *p);
```

Argument:

p Object address.

Return Value:

Returns the PSV page number offset of the object whose address is given as a parameter.

Assembler Operator/Machine Instruction:

```
psvoffset
```

Error Messages:

The following error message is produced when this function is used incorrectly:

"Argument to __builtin_psvoffset() is not the address of an object in code, PSV or EE data section".

The argument must be an explicit object address.

For example, if *obj* is an object in an executable or read-only section, the following syntax is valid:

```
unsigned page = __builtin_psvoffset(&obj);
```

© 2005-2018 Microchip Technology Inc.

__builtin_psvpage

Description:

Returns the PSV page number of the object whose address is given as a parameter. The argument *p* must be the address of an object in an EE data, PSV or executable memory space; otherwise, an error message is produced and the compilation fails. See the `space` attribute in **Section 2.3.1 "Specifying Attributes of Variables"** of the *"MPLAB® C Compiler for PIC24 MCUs and dsPIC® DSCs User's Guide"* (DS51284).

Prototype:

```
unsigned int __builtin_psvpage(const void *p);
```

Argument:

p Object address.

Return Value:

Returns the PSV page number of the object whose address is given as a parameter.

Assembler Operator/Machine Instruction:

```
psvpage
```

Error Messages:

The following error message is produced when this function is used incorrectly:

"Argument to `__builtin_psvpage()` is not the address of an object in code, PSV or EE data section".

The argument must be an explicit object address.

For example, if *obj* is an object in an executable or read-only section, the following syntax is valid:

```
unsigned page = __builtin_psvpage(&obj);
```

__builtin_readsfr

Description:

Reads the SFR.

Prototype:

```
unsigned int __builtin_readsfr(const void *p);
```

Argument:

p Object address.

Return Value:

Returns the SFR.

Assembler Operator/Machine Instruction:

```
readsfr
```

__builtin_return_address

Description:

Returns the return address of the current function or of one of its callers. For the *level* argument, a value of 0 yields the return address of the current function, a value of 1 yields the return address of the caller of the current function, and so forth. When *level* exceeds the current stack depth, 0 will be returned. This function should only be used with a non-zero argument for debugging purposes.

Prototype:

```
int __builtin_return_address (const int level);
```

Argument:

level Number of frames to scan up the call stack.

Return Value:

Returns the return address of the current function or of one of its callers.

Assembler Operator/Machine Instruction:

```
return_address
```

__builtin_sac

Description:

Shifts value by *shift* (a literal between -8 and 7) and returns the value.

For example:

```
register int value asm("A");
int      result;

result = __builtin_sac(value,3);
```

May generate:

```
sac A, #3, w0
```

Prototype:

```
int __builtin_sac(int value, int shift);
```

Argument:

value Integer number to be shifted.
shift Literal amount to shift.

Return Value:

Returns the shifted result to an accumulator.

Assembler Operator/Machine Instruction:

```
sac
```

Error Messages:

An error message appears if:

- The result is not an Accumulator register
- The shift value is not a literal within range

© 2005-2018 Microchip Technology Inc.

__builtin_sacr

Description:

Shifts value by *shift* (a literal between -8 and 7) and returns the value, which is rounded using the Rounding mode determined by the RND (CORCON<1>) control bit.

For example:

```
register int value asm("A");
int      result;

result = __builtin_sac(value,3);
```

May generate:

```
sac.r A, #3, w0
```

Prototype:

```
int __builtin_sacr(int value, int shift);
```

Argument:

value Integer number to be shifted.
shift Literal amount to shift.

Return Value:

Returns the shifted result to the CORCON register.

Assembler Operator/Machine Instruction:

```
sacr
```

Error Messages:

An error message appears if:

- The result is not an Accumulator register
- The shift value is not a literal within range

__builtin_sftac

Description:

Shifts accumulator by *shift*. The valid shift range is -16 to 16.

For example:

```
register int result asm("A");
int      i;

result = __builtin_sftac(result,i);
```

May generate:

```
sftac A, w0
```

Prototype:

```
int __builtin_sftac(int Accum, int shift);
```

Argument:

Accum Accumulator to shift.
shift Amount to shift.

Return Value:

Returns the shifted result to an accumulator.

Assembler Operator/Machine Instruction:

```
sftac
```

Error Messages:

An error message appears if:

- The result is not an Accumulator register
- *Accum* is not an Accumulator register
- The shift value is not a literal within range

© 2005-2018 Microchip Technology Inc.

__builtin_subab

Description:

Subtracts Accumulators A and B with the result written back to the specified accumulator. For example:

```
register int result asm("A");
register int B asm("B");
result = __builtin_subab(result,B);
```

Will generate:

```
sub A
```

Prototype:

```
int ___builtin_subab(int Accum_a, int Accum_b);
```

Argument:

Accum_a Accumulator from which to subtract.
Accum_b Accumulator to subtract.

Return Value:

Returns the subtraction result to an accumulator.

Assembler Operator/Machine Instruction:

```
sub
```

Error Messages:

An error message appears if the result is not an Accumulator register.

__builtin_tbladdress

Description:

Returns a value that represents the address of an object in program memory. The argument *p* must be the address of an object in an EE data, PSV or executable memory space; otherwise, an error message is produced and the compilation fails. See the `space` attribute in **Section 2.3.1 "Specifying Attributes of Variables"** of the *"MPLAB® C Compiler for PIC24 MCUs and dsPIC® DSCs User's Guide"* (DS51284).

Prototype:

```
unsigned long __builtin_tblpage(const void *p);
```

Argument:

p Object address.

Return Value:

Returns an `unsigned long` value that represents the address of an object in program memory.

Assembler Operator/Machine Instruction:

```
tbladdress
```

Error Messages:

The following error message is produced when this function is used incorrectly:

"Argument to `__builtin_tbladdress()` is not the address of an object in code, PSV or EE data section".

The argument must be an explicit object address.

For example, if *obj* is an object in an executable or read-only section, the following syntax is valid:

```
unsigned long page = __builtin_tbladdress(&obj);
```

__builtin_tbloffset

Description:

Returns the table page offset of the object whose address is given as a parameter. The argument *p* must be the address of an object in an EE data, PSV or executable memory space; otherwise, an error message is produced and the compilation fails. See the `space` attribute in **Section 2.3.1 "Specifying Attributes of Variables"** of the *"MPLAB® C Compiler for PIC24 MCUs and dsPIC® DSCs User's Guide"* (DS51284).

Prototype:

```
unsigned int __builtin_tbloffset(const void *p);
```

Argument:

p Object address.

Return Value:

Returns the table page number offset of the object whose address is given as a parameter.

Assembler Operator/Machine Instruction:

```
tbloffset
```

Error Messages:

The following error message is produced when this function is used incorrectly:

"Argument to `__builtin_tbloffset()` is not the address of an object in code, PSV or EE data section".

The argument must be an explicit object address.

For example, if *`obj`* is an object in an executable or read-only section, the following syntax is valid:

```
unsigned page = __builtin_tbloffset(&obj);
```

© 2005-2018 Microchip Technology Inc.

__builtin_tblpage

Description:

Returns the table page number of the object whose address is given as a parameter. The argument *p* must be the address of an object in an EE data, PSV or executable memory space; otherwise, an error message is produced and the compilation fails. See the `space` attribute in **Section 2.3.1 "Specifying Attributes of Variables"** of the *"MPLAB® C Compiler for PIC24 MCUs and dsPIC® DSCs User's Guide"* (DS51284).

Prototype:

```
unsigned int __builtin_tblpage(const void *p);
```

Argument:

p Object address.

Return Value:

Returns the table page number of the object whose address is given as a parameter.

Assembler Operator/Machine Instruction:

```
tblpage
```

Error Messages:

The following error message is produced when this function is used incorrectly:

"Argument to `__builtin_tblpage()` is not the address of an object in code, PSV or EE data section".

The argument must be an explicit object address.

For example, if *obj* is an object in an executable or read-only section, the following syntax is valid:

```
unsigned page = __builtin_tblpage(&obj);
```

__builtin_tblrdh

Description:

Issues the `TBLRDH.W` instruction to read a word from Flash or EE data memory. You must set up the TBLPAG to point to the appropriate page. To do this, you may make use of: `__builtin_tbloffset()` and `__builtin_tblpage()`.

Please refer to the specific device data sheet or the appropriate family reference manual for complete details regarding reading and writing program Flash.

Prototype:

```
unsigned int __builtin_tblrdh(unsigned int offset);
```

Argument:

offset Desired memory offset.

Return Value:

None.

Assembler Operator/Machine Instruction:

```
tblrdh
```

Error Messages:

None.

__builtin_tblrdl

Description:

Issues the TBLRDL.W instruction to read a word from Flash or EE data memory. You must set up the TBLPAG to point to the appropriate page. To do this, you may make use of: __builtin_tbloffset() and__builtin_tblpage().

Please refer to the specific device data sheet or the appropriate family reference manual for complete details regarding reading and writing program Flash.

Prototype:

```
unsigned int __builtin_tblrdl(unsigned int offset);
```

Argument:

offset Desired memory offset.

Return Value:

None.

Assembler Operator/Machine Instruction:

```
tblrdl
```

Error Messages:

None.

__builtin_tblwth

Description:

Issues the TBLWTH.W instruction to write a word to Flash or EE data memory. You must set up the TBLPAG to point to the appropriate page. To do this, you may make use of: __builtin_tbloffset() and __builtin_tblpage().

Please refer to the specific device data sheet or the appropriate family reference manual for complete details regarding reading and writing program Flash.

Prototype:

```
void     __builtin_tblwth(unsigned int offset
unsigned int data);
```

Argument:

offset Desired memory offset.
data Data to be written.

Return Value:

None.

Assembler Operator/Machine Instruction:

```
tblwth
```

Error Messages:

None.

© 2005-2018 Microchip Technology Inc.

__builtin_tblwtl

Description:

Issues the TBLRDL.W instruction to write a word to Flash or EE data memory. You must set up the TBLPAG to point to the appropriate page. To do this, you may make use of: __builtin_tbloffset() and __builtin_tblpage().

Please refer to the specific device data sheet or the appropriate family reference manual for complete details regarding reading and writing program Flash.

Prototype:

```
void     __builtin_tblwtl(unsigned int offset
unsigned int data);
```

Argument:

offset Desired memory offset.
data Data to be written.

Return Value:

None.

Assembler Operator/Machine Instruction:

```
tblwtl
```

Error Messages:

None.

Example 6-1: Additional In-Line Functions

Section 7. Reference

HIGHLIGHTS

This section of the manual contains the following major topics:

7.1 Instruction Bit Map 498
7.2 Instruction Set Summary Table 501
7.3 Revision History 511

7.1 INSTRUCTION BIT MAP

Instruction encoding for the 16-bit MCU and DSC family devices is summarized in Table 7-1. This table contains the encoding for the MSB of each instruction. The first column in the table represents bits<23:20> of the opcode and the first row of the table represents bits 19:16 of the opcode. The first byte of the opcode is formed by taking the first column bit value and appending the first row bit value. For instance, the MSB of the PUSH instruction (last row, ninth column) is encoded with '11111000b' (0xF8).

Note: The complete opcode for each instruction may be determined by the instruction descriptions in **Section 5. "Instruction Descriptions"**, using Table 5-1 through Table 5-15.

7.2 INSTRUCTION SET SUMMARY TABLE

The complete 16-bit MCU and DSC device instruction set is summarized in Table 7-2. This table contains an alphabetized listing of the instruction set. It includes instruction assembly syntax, description, size (in 24-bit words), execution time (in instruction cycles), affected Status bits and the page number in which the detailed description can be found. Table 1-2 identifies the symbols that are used in the Instruction Set Summary Table.

Note: The instruction cycle counts listed here are for PIC24F, PIC24H, dsPIC30F and dsPIC33F devices. Some instructions require additional cycles in PIC24E and dsPIC33E devices. Refer to **Section 3.3 "Instruction Set Summary Tables"** and **Section 5.4 "Instruction Descriptions"** for details.

Table 7-2: Instruction Set Summary Table

7.3 REVISION HISTORY

Revision A (May 2005)

This is the initial release of this document.

Revision B (September 2005)

This revision incorporates all known errata at the time of this document update.

Revision C (February 2008)

This revision includes the following corrections and updates:

- Instruction Updates:
  - Updated BRA Instruction (see **"BRA"**)
  - Updated DIVF Instruction (see **"DIVF"**)
  - Updated DO Instruction (see **"DO"**)
  - Updated SUB instruction (see **"SUB"**)

Revision D (November 2009)

This revision includes the following corrections and updates:

- Document renamed from dsPIC30F/33F Programmer's Reference Manual to 16-bit MCU and DSC Programmer's Reference Manual
- Document has been completely redesigned to accommodate all current 16-bit families: dsPIC30F, dsPIC33F, PIC24F and PIC24H

Revision E (June 2010)

This revision includes the following corrections and updates:

- Information specific to dsPIC33E and PIC24E devices has been added throughout the document

Revision F (July 2011)

This revision includes the following corrections and updates:

- Added a new section **"Built-in Functions"**
- Added and updated the cross-references throughout the document
- Updated the bit characteristics from U to U-0 in Register 2-4 and Register 2-6
- Added a note throughout the document specifying the requirement of an additional cycle for read and read-modify-write operations on non-CPU special function registers in dsPIC33E and PIC24E devices
- Updates to formatting and minor text changes were incorporated throughout the document

Revision G (April 2018)

This revision includes the following corrections and updates:

- Information specific to dsPIC33C devices has been added throughout the document
- Updates to formatting and minor text changes were incorporated throughout the document

Code Examples
- 'Z' Status Bit Operation for 32-Bit Addition ... 79
- 32-Bit Signed Multiplication Using Implicit Mixed-Sign Mode ... 94
- Additional In-Line Functions ... 494
- Base MAC Syntax ... 88
- Divide_32_by_16 ... 495
- File Register Addressing ... 55
- File Register Addressing and WREG ... 55
- Frame Pointer Usage ... 75
- Illegal Word Move Operations ... 70
- Immediate Addressing ... 61
- Indirect Addressing with Effective Address Update ... 57
- Indirect Addressing with Register Offset ... 58
- Legal Word Move Operations ... 69
- MAC Accumulator WB Syntax ... 89
- MAC Prefetch Syntax ... 88
- Move with Literal Offset Instructions ... 58
- Moving Data with WREG ... 82
- MSC Instruction with Two Prefetches and Accumulator Write-Back ... 89
- Normalizing with FBCL ... 93
- Register Direct Addressing ... 56
- Sample Byte Math Operations ... 67
- Sample Byte Move Operations ... 66
- Scaling with FBCL ... 91
- Stack Pointer Usage ... 73
- Unsigned f and WREG Multiply (Legacy MULWF Instruction) ... 82
- Using 10-Bit Literals for Byte Operands ... 71
- Using the Default Working Register, WREG ... 81

Conditional Branch Instructions ... 78
Core Control Register ... 25

D

Data Addressing Mode Tree ... 61
Data Addressing Modes ... 54
Data Range Limit Instructions ... 92
- FLIM/FLIM.V ... 92
- MAX/MAX.V ... 92
- MIN/MIN.V/MINZ ... 92

DCOUNT Register ... 21
Default Working Register (WREG) ... 20, 81
Destination Addressing Modes for MCU Multiplications ... 97
Development Support ... 6
DO Stack ... 26
DOEND Register ... 22
DOSTART Register ... 22
DSP Accumulator Instructions ... 90
DSP Data Formats ... 83
DSP MAC Indirect Addressing Modes ... 59
DSP MAC Instructions ... 86

E

Extended Precision Arithmetic using Mixed-Sign Multiplications ... 94

F

File Register Addressing ... 54

I

Immediate Addressing ... 60
- Operands in the Instruction Set ... 60

Implied DSP Operands ... 80
Implied Frame and Stack Pointer ... 81
Instruction Bit Map ... 498
Instruction Description Example ... 101
Instruction Descriptions ... 102
- ADD (16-Bit Signed Add to Accumulator) ... 108
- ADD (Add Accumulators) ... 107
- ADD (Add f to WREG) ... 102
- ADD (Add Literal to Wn) ... 103
- ADD (Add Wb to Short Literal) ... 104
- ADD (Add Wb to Ws) ... 105
- ADDC (Add f to WREG with Carry) ... 110
- ADDC (Add Literal to Wn with Carry) ... 111
- ADDC (Add Wb to Short Literal with Carry) ... 112
- ADDC (Add Wb to Ws with Carry) ... 114
- AND (AND f and WREG) ... 116
- AND (AND Literal and Wn) ... 117
- AND (AND Wb and Short Literal) ... 118
- AND (AND Wb and Ws) ... 119
- ASR (Arithmetic Shift Right by Short Literal) ... 125
- ASR (Arithmetic Shift Right by Wns) ... 126
- ASR (Arithmetic Shift Right f) ... 121
- ASR (Arithmetic Shift Right Ws) ... 123
- BCLR (Bit Clear in f) ... 127
- BCLR (Bit Clear in Ws) ... 128
- BFEXT (Bit Field Extract from f into Wnd) ... 131
- BFEXT (Bit Field Extract from Ws into Wnd) ... 130
- BFINS (Bit Field Insert from Wb into Wd) ... 132
- BFINS (Bit Field Insert from Wns into f) ... 133
- BFINS (Bit Field Insert Literal into Ws) ... 134
- BOOTSWP (Swap Active and Inactive Flash Address Panel) ... 135
- BRA (Branch Unconditionally) ... 136
- BRA (Computed Branch) ... 137, 138
- BRA C (Branch if Carry) ... 139
- BRA GE (Branch if Signed Greater Than or Equal) ... 141
- BRA GEU (Branch if Unsigned Greater Than or Equal) ... 142
- BRA GT (Branch if Signed Greater Than) ... 143
- BRA GTU (Branch if Unsigned Greater Than) ... 144
- BRA LE (Branch if Signed Less Than or Equal) ... 145
- BRA LEU (Branch if Unsigned Less Than or Equal) ... 146
- BRA LT (Branch if Signed Less Than) ... 147
- BRA LTU (Branch if Unsigned Less Than) ... 148
- BRA N (Branch if Negative) ... 149
- BRA NC (Branch if Not Carry) ... 150
- BRA NN (Branch if Not Negative) ... 151
- BRA NOV (Branch if Not Overflow) ... 152
- BRA NZ (Branch if Not Zero) ... 153
- BRA OA (Branch if Overflow Accumulator A) ... 154
- BRA OB (Branch if Overflow Accumulator B) ... 155
- BRA OV (Branch if Overflow) ... 156
- BRA SA (Branch if Saturation Accumulator A) ... 157
- BRA SB (Branch if Saturation Accumulator B) ... 158
- BRA Z (Branch if Zero) ... 159
- BSET (Bit Set in f) ... 160
- BSET (Bit Set in Ws) ... 161
- BSW (Bit Write in Ws) ... 163

BTSTS (Bit Test/Set in f) 180
BTSTS (Bit Test/Set in Ws) 181
CALL (Call Indirect Subroutine) 187, 189
CALL (Call Subroutine) 183, 185
CALL.L (Call Indirect Subroutine Long) 191
CLR (Clear Accumulator, Prefetch Operands) 194
CLR (Clear f or WREG) 192
CLR (Clear Wd) 193
CLRWDT (Clear Watchdog Timer) 196
COM (Complement f) 197
COM (Complement Ws) 198
CP (Compare f with WREG, Set Status Flags) 200
CP (Compare Wb with lit5, Set Status Flags) 201
CP (Compare Wb with lit8, Set Status Flags) 202
CP (Compare Wb with Ws, Set Status Flags) 203
CP0 (Compare f with 0x0, Set Status Flags) 204
CP0 (Compare Ws with 0x0, Set Status Flags) 205
CPB (Compare f with WREG Using Borrow, Set Status Flags) 206
CPB (Compare Wb with lit5 Using Borrow, Set Status Flags) 207
CPB (Compare Wb with lit8 Using Borrow, Set Status Flags) 208
CPB (Compare Ws with Wb Using Borrow, Set Status Flags) 209
CPBEQ (Compare Wb with Wn, Branch if Equal) 211
CPBGT (Signed Compare Wb with Wn, Branch if Greater Than) 212
CPBLT (Signed Compare Wb with Wn, Branch if Less Than) 213
CPBNE (Compare Wb with Wn, Branch if Not Equal) 214
CPSEQ (Compare Wb with Wn, Skip if Equal) 215, 216
CPSGT (Signed Compare Wb with Wn, Skip if Greater Than) 217
CPSGT (Signed Compare Wb with Wn, Skip if Greater Than) 218
CPSLT (Signed Compare Wb with Wn, Skip if Less Than) 219, 220
CPSNE (Signed Compare Wb with Wn, Skip if Not Equal) 221, 222
CTXTSWP (CPU Register Context Swap Literal) 223
CTXTSWP (CPU Register Context Swap Wn) 224
DAW.B (Decimal Adjust Wn) 225
DEC (Decrement f) 226
DEC (Decrement Ws) 227
DEC2 (Decrement f by 2) 229
DEC2 (Decrement Ws by 2) 230
DISI (Disable Interrupts Temporarily) 232
DIV.S (Signed Integer Divide) 233
DIV.U (Unsigned Integer Divide) 235
DIV2.S (Signed Integer Divide) 240
DIV2.U (Unsigned Integer Divide) 241
DIVF (Fractional Divide) 236
DIVF2 (Signed Fractional Divide, 16/16) 238
DO (Initialize Hardware Loop Literal) 242, 244
DO (Initialize Hardware Loop Wn) 246, 248
ED (Euclidean Distance 250
ED (Euclidean Distance, No Accumulate) 250
EDAC (Euclidean Distance) 252
EXCH (Exchange Wns and Wnd) 254
FBCL (Find First Bit Change from Left) 255
FF1L (Find First One from Left) 257
FF1R (Find First One from Right) 259
FLIM (Force (Signed) Data Range Limit) 261
FLIM.V (Force (Signed) Data Range Limit with Limit Excess Result) 262
GOTO (Unconditional Indirect Jump) 264, 265
GOTO (Unconditional Jump) 263
GOTO.L (Unconditional Indirect Jump Long) 266
INC (Increment f) 267
INC (Increment Ws) 268
INC2 (Increment f by 2) 269
INC2 (Increment Ws by 2) 270
IOR (Inclusive OR f and WREG) 271
IOR (Inclusive OR Literal and Wn) 272
IOR (Inclusive OR Wb and Short Literal) 273
IOR (Inclusive OR Wb and Ws) 274
LAC (Load Accumulator) 276
LAC.D (Load Accumulator Double) 278
LDSLV (Load Slave Processor Program RAM) 279
LNK (Allocate Stack Frame) 280, 281
LSR (Logical Shift Right by Short Literal) 286
LSR (Logical Shift Right by Wns) 287
LSR (Logical Shift Right f) 282
LSR (Logical Shift Right Ws) 284
MAC (Multiply and Accumulate) 288
MAC (Square and Accumulate) 290
MAX (Accumulator Force Maximum Data Range Limit) 292
MAX.V (Accumulator Force Maximum Data Range Limit with Limit Excess Result) 293
MIN (Accumulator Force Minimum Data Range Limit) 294
MIN.V (Accumulator Force Minimum Data Range Limit with Limit Excess Result) 295
MINZ (Accumulator Force Minimum Data Range Limit) 296
MINZ.V (Accumulator Force Minimum Data Range Limit with Limit Excess Result) 297
MOV (Move 16-Bit Literal to Wnd) 304
MOV (Move f to Destination) 299
MOV (Move f to Wnd) 301
MOV (Move Wns to f) 302
MOV (Move WREG to f) 300
MOV (Move Ws to Wd) 307
MOV.B (Move 8-Bit Literal to Wnd) 303
MOV.D (Double-Word Move from Source to Wnd) 309
MOVPAG (Move Literal to Page Register) 311
MOVPAG (Move Wn to Page Register) 312
MOVSAC (Prefetch Operands and Store Accumulator) 313
MPY (Multiply Wm by Wn to Accumulator) 315
MPY (Square to Accumulator) 317
MPY.N (Multiply -Wm by Wn to Accumulator) 319
MSC (Multiply and Subtract from Accumulator) 321
MUL (Integer Unsigned Multiply f and WREG) 323
MUL.SS (Integer 16x16-Bit Signed Multiply with Accumulator Destination) 327
MUL.SS (Integer 16x16-Bit Signed Multiply) 325
MUL.SU (Integer 16x16-Bit Signed-Unsigned Multiply with Accumulator Destination) 331

© 2005-2018 Microchip Technology Inc.

MUL.SU (Integer 16x16-Bit Signed-Unsigned Multiply) 329
MUL.SU (Integer 16x16-Bit Signed-Unsigned Short Literal Multiply with Accumulator Destination) 332
MUL.SU (Integer 16x16-Bit Signed-Unsigned Short Literal Multiply) 328
MUL.US (Integer 16x16-Bit Unsigned-Signed Multiply with Accumulator Destination) 335
MUL.US (Integer 16x16-Bit Unsigned-Signed Multiply) 333
MUL.UU (Integer 16x16-Bit Unsigned Multiply with Accumulator Destination) 339
MUL.UU (Integer 16x16-Bit Unsigned Multiply) 337
MUL.UU (Integer 16x16-Bit Unsigned Short Literal Multiply with Accumulator Destination) 340
MUL.UU (Integer 16x16-Bit Unsigned Short Literal Multiply) 336
MULW.SS (Integer 16x16-Bit Signed Multiply with 16-Bit Result) 341
MULW.SU (Integer 16x16-Bit Signed-Unsigned Multiply with 16-Bit Result) 343
MULW.SU (Integer 16x16-Bit Signed-Unsigned Short Literal Multiply with 16-Bit Result) 345
MULW.US (Integer 16x16-Bit Unsigned-Signed Multiply with 16-Bit Result) 346
MULW.UU (Integer 16x16-Bit Unsigned Multiply with 16-Bit Result) 348
MULW.UU (Integer 16x16-Bit Unsigned Short Literal Multiply with 16-Bit Result) 349
NEG (Negate Accumulator) 353
NEG (Negate f) 350
NEG (Negate Ws) 351
NOP (No Operation) 354
NOPR (No Operation) 355
NORM (Normalize Accumulator) 356
POP (Pop TOS to f) 357
POP (Pop TOS to Wd) 358
POP.D (Double Pop TOS to Wnd/Wnd+1) 359
POP.S (Pop Shadow Registers) 360
PUSH (Push f to TOS) 361
PUSH (Push Ws to TOS) 362
PUSH.D (Double Push Wns/Wns+1 to TOS) 364
PUSH.S (Push Shadow Registers) 365
PWRSAV (Enter Power-Saving Mode) 366
RCALL (Computed Relative Call) 371, 373
RCALL (Relative Call) 367, 369
REPEAT (Repeat Next Instruction 'lit14+1' Times) 375
REPEAT (Repeat Next Instruction 'lit15+1' Times) 376
REPEAT (Repeat Next Instruction Wn+1 Times) 377, 378
RESET (Reset) 379
RETFIE (Return from Interrupt) 380, 381
RETLW (Return with Literal in Wn) 382, 384
RETURN (Return) 386, 387
RLC (Rotate Left f through Carry) 388
RLC (Rotate Left Ws through Carry) 389
RLNC (Rotate Left f without Carry) 391
RLNC (Rotate Left Ws without Carry) 392
RRC (Rotate Right f through Carry) 394
RRC (Rotate Right Ws through Carry) 396
RRNC (Rotate Right f without Carry) 398
RRNC (Rotate Right Ws without Carry) 399
SAC (Store Accumulator) 401
SAC.D (Store Accumulator Double) 403
SAC.R (Store Rounded Accumulator) 404
SE (Sign-Extend Ws) 406
SETM (Set f or WREG) 408
SETM (Set Ws) 409
SFTAC (Arithmetic Shift Accumulator by Slit6) 410
SFTAC (Arithmetic Shift Accumulator by Wb) 411
SL (Shift Left by Short Literal) 416
SL (Shift Left by Wns) 417
SL (Shift Left f) 412
SL (Shift Left Ws) 414
SUB (Subtract Accumulators) 423
SUB (Subtract Literal from Wn) 419
SUB (Subtract Short Literal from Wb) 420
SUB (Subtract WREG from f) 418
SUB (Subtract Ws from Wb) 421
SUBB (Subtract Short Literal from Wb with Borrow) 426
SUBB (Subtract Wn from Literal with Borrow) 425
SUBB (Subtract WREG and Carry Bit from f) 424
SUBB (Subtract Ws from Wb with Borrow) 428
SUBBR (Subtract f from WREG with Borrow) 430
SUBBR (Subtract Wb from Short Literal with Borrow) 431
SUBBR (Subtract Wb from Ws with Borrow) 433
SUBR (Subtract f from WREG) 435
SUBR (Subtract Wb from Short Literal) 436
SUBR (Subtract Wb from Ws) 437
SWAP (Byte or Nibble Swap Wn) 439
TBLRDH (Table Read High) 440
TBLRDL (Table Read Low) 442
TBLWTH (Table Write High) 444
TBLWTL (Table Write Low) 446
ULNK (Deallocate Stack Frame) 448, 449
VFSLV (Verify Slave Processor Program RAM) 450
XOR (Exclusive OR f and WREG) 451
XOR (Exclusive OR Literal and Wn) 452
XOR (Exclusive OR Wb and Short Literal) 453
XOR (Exclusive OR Wb and Ws) 454
ZE (Zero-Extend Ws) 456
